The Kingdom of Morocco or Moohreb-el-Aksa occupies the north-west corner of Africa, between 28° and 36° N. lat., and 11° 30′ W. and 2° 30′ E. long., measuring about 700 miles in extreme length, and 300 in breadth. It covers, according to Graberg, a surface of 24,970 square leagues; about 2,000 square English miles, with a sea-coast on the Mediterranean, extending from Tangier to Cape Spartel, 250 miles, and on the Atlantic 500 miles, from Cape Spartel to Cape Aguer. Washington, however, makes the superficial extent only 134,000 square geographical miles, and Captain Washington 170,000; and, indeed, as the eastern border, towards the desert is ill defined, no certain statement of its extent can properly be formed. This kingdom, or empire consists, within its actual limits, of the kingdom of Fez, Fes or Fas, to the north of the river Om-erbegh; of that of Morocco, with part of the late kingdom of Sus, to the south of that river, of the kingdom of Tafilelt, the country of Sahara, and the district of El Hharrits, all to the east and south of the Atlas. Morocco and Fez are subdivided into 31 provinces, some of which are very large, while others consist of no more than a town with the adjoining district.

The people of the empire are distributed by Graberg, according to their races, in the following manner: —

Amazirghs.	Berbers and Tuaricks,	2,300,000
	Shelluhhs,	1,400,000
	Moors and mixed Arabs,	3,350,000
	Bedwins and pure Arabs,	750,000
	Jews,	350,000
	Negroes,	120,000
Europeans.	Christians,	3,000
	Renegadoes,	2,000
		8,300,000

Other authorities differ very much from M. Graberg.

Jackson estimates the population at	14,800,000
Hoest, Danish Consul, 1760–65,	6,000,000
Chenier, French Charge d'Affaires, between 1770 and 1780,	6,000,000
Washington, 1836,	5,000,000
Balbi Abregé, 3me. edition, 1837,	6,000,000

Their distribution in the different divisions of the empire should be as follows: —

	Sq. leagues.	*Inhabitants.*
Kingdom of Fez,	9654	3,200,000
—— Morocco,	5709	3,000,000
Tafilelt and Segmessa,	3184	700,000
Al Draha and Sus,	5833	1,000,000
	24,370	7,900,000

which gives 316 inhabitants to the square league. The towns are neither numerous nor populous. Morocco contains only 50,000 inhabitants; Mokuenez, 50,000; Fez, 80,000. There are three others with from 20,000 to 30,000 inhabitants; two from 15,000 to 20,000; five from 10,000 to 15,000; and from 5,000 to 10,000.

The government is simple despotism, in which the will of the Sultan is predominant. The sultan is head of both church and state, which are inseparable. The laws are the will of a despot. In the capital the Sultan administers justice in person; and in the provinces the governors, styled Bashaws or Caids, faithfully copy their imperial master; yet, when these rulers have no personal resentment to gratify, their judgments are generally correct, and always prompt. Their ruling principle of government seems to be, to keep the people poor and in a condition in which they are unable to rebel. The revenue is derived from taxes paid in kind, one tenth of corn, and one twentieth of cattle, a capitation tax on all Jews, and fines on districts where crimes have been committed; but it is very unequal, and often requires to be levied by force from some of the Arab tribes. Its amount is estimated by Captain Washington at 11,000,000, M. Graberg makes it 20,000,000 dollars, while the expenditure amounts only to 6,000,000, leaving a large surplus to be buried in the imperial treasury. The regular military establishment does not at present exceed 15,000 or 16,000 men, of whom one half are negroes. They are distributed in garrisons and shifting camps, forts, seaports, and in the imperial residences. About one half of the number is cavalry. This force can be easily increased to ten-fold, when required, by levies of the civic militia, and Bedwin cavalry. The militia receive no pay, but are furnished with horses, and when those of the provinces visit the capital, they receive a trifling present; they are generally expert horsemen and good marksmen, but are destitute of any sort of discipline. At the accession of Mulei Suleiman to the throne in 1793, the naval armament consisted of 10 frigates, 11 corvettes, 14 schooners, and 12 sloops, manned by 6000 intrepid seamen. The naval force at present consists of 3 brigs, mounting altogether about 40 guns, and 13 sloops stationed at the mouths of the principal rivers. When piracy was put an end to by the superior power of the Europeans, armed vessels were found to be of little use, and too costly. The present empire was established in 1517 by a sherif, a descendant of Mahomet, whose posterity still enjoy the sovereignty, after having survived frequent revolutions. The sovereign conjoins the title of sherif to that of sultan. Some of these princes have been able men: but generally they have exhibited a peculiarly jealous and ferocious character. Morocco has been ruled by some of the most blood-thirsty tyrants recorded in history. The distinction of sherif descends to all their male offspring, and consequently preserves them from the obscurity which so soon involves the posterity of other Moslem princes. The sherifs, indeed, of this family may be said to constitute a very powerful clan, being not fewer, perhaps, than 10,000, who chiefly reside in Tafilelt; nor will their numbers surprise us, when we consider that Mulai Sherif, the founder of the dynasty, had 81 sons and 124 daughters; and that his son Mulai-Ismael possessed a family of 821 sons, and 525 daughters! The succession to the throne is generally disputed by several of the sherifs; and one of them lately (1810) founded an independent state (Bilad-Sidi-Hesham) in the southern part of the empire.

Industry and commerce are very limited. The only important manufacture is that of the leather which bears the name of morocco; one tannery in the capital employs so many as 1500 persons; and, though the processes are slovenly, a fine yellow colour is produced, which Europeans cannot rival. The other articles of exportation are almonds of very fine quality from Sus, dates from Tafilelt, ivory and gold dust from Soudan; honey, wax, ostrich feathers, &c. In return, the kingdom receives the usual articles of European and colonial produce; and its trade is carried on chiefly by the port of Mogadore.

Marocco (Marakesh, Morocco), the capital, is situate near the northern limit of a large plain, 1500 feet above the level of the sea, in 31° 37′ 30″ N. lat., and 7° 36′ W. long. The city is six miles in circuit, enclosed by a strongly-built machicolated wall of tapia-work, with square towers, and containing eleven double gates; but this area is far from being generally covered with buildings, it comprises large gardens, and open spaces of 20 or 30 acres in extent. The streets are narrow and irregular, having the appearance of lanes, lined with houses, usually of one storey, and flat-roofed. The city contains 19 mosques, 2 madreses or colleges, and 1 hospital. The principal mosque has a lofty square tower of seven storeys, 220 feet high; its height being apparently seven times its diameter, with a small turret or lantern on the top. The palace occupies a separate enclosure on the south side of the city, measuring about 1,00 yards by 600, occupied chiefly by gardens, pavilions, and other usual ornaments. The population is about 50,000. The city is placed in the midst of a forest of palms; and the plain in which it stands extends east and west between a low range of schistose hills to the north, and the Atlas to the south, having a breadth of 25 miles, apparently a dead flat to the foot of the mountains, but the limits as far as the eye can reach east and west are undefined. The Wady Tensift runs through it, and is crossed a few miles north of the city by a bridge (*alkantrah*) of 30 arches. The city is supplied with water, which is brought from the Atlas, at the distance of 20 miles, by spacious aqueducts.

Fez (Fes, Fas), the capital of the kingdom of that name, and once the metropolis of Moghreb-ul-Aksa, is situate in 34° 6′ N. lat., and 4° 58′ W. long., on the banks of an affluent of the Seboo, in a hollow valley formed by woody mountains. The houses, built of well made fire-burned bricks, are generally two storeys high, containing a court in the centre, and flat-roofed. The streets are paved but narrow, winding, and dirty. Fez contains a number of mosques, with minarets 100 feet high; but has no other remarkable buildings. It has, likewise, sulphureous and chalybeate baths, which are well frequented; and Ali Bey (Bahdia) who visited Fez about 30 years ago, speaks of its schools, as celebrated over all Africa, and of its library, as being very considerable for such a country. The population is reckoned about 88,000. Woollen coverlets, swords, and fire-arms, morocco leather, gunpowder, and other articles, employ a great portion of its inhabitants, who also carry on a very extensive commerce.

Mekinez (Miknasah, Mequinez) 33 miles W. by S. of Fez, is chiefly important as an imperial residence, and is situate in a well cultivated valley. The palace is a vast square fortified building; and the population of the city is reckoned at 56,000. The other towns of the empire are unimportant. *Tetuan*, 20 miles S. of Ceuta, possesses the only harbour on the Mediterranean coast; and has a considerable trade and population. *Tangier*, a little to the east of Cape Spartel, has a good harbour, and a very active trade, and is an ordinary residence of the European consuls. *El Araish* or *Laraahe*, at the mouth of the river Luccos, is the ordinary station of the imperial fleet. *Sla* (Salee) at the mouth of the Buregreg, the resort of the formidable pirates who scoured the seas in the 17th and early part of the 18th centuries, has very much declined, though it still contains about 10,000 inhabitants. *Rabat* or *New Salee*, on the opposite side of the river, is still one of the principal towns of the empire, and has a population amounting to 25,000. *Al Kasar*, 82 miles N.W. of Fez, a very decayed city, still contains 8000 inhabitants. *Mogadore*, 130 miles W. of Marocco, in 31° 30′ N. lat., 9° 47′ W. long., with 10,000 inhabitants, which was regularly rebuilt in 1760, fortified and provided with a harbour, which is now choked up with sand, is the first maritime station, and the most commercial town in the empire. *Agadir* or *Santa Cruz*, 75 miles S. of Mogadore, is a port on the Atlantic, formerly belonging to the Portuguese. *Faradant*, the capital of the province of Sus, has an industrious population of 20,000 or 22,000 souls; and *Tagavost*, in the same province, is said to be larger still. Of the towns in Tafilelt and Sigelmessa little or nothing is known.

SIDI-HESHAM'S COUNTRY (*Bilad-Sidi-Hesham*), a new state, founded in 1810, by Sidi-Hesham, the son of the Sherif Achmed-ebn-Mousay, is composed of a part of the province of Sus, and extends to the east and south of that country. Inhabited by an industrious, agricultural, mercantile, and warlike people, it seems to have become the centre of the trade between Marocco and Timbuctoo; the Moorish merchants preferring to stop here rather than cross the desert. *Talent* is the capital; and at *Ilegh* is the venerated tomb of the Sherif Achmed, the father of Hesham. The southern part of the state includes the large valley and river of *Wady-Nun*.

ALGIERS extends along the Mediterranean Sea, eastward from Marocco, between 2° W. and 8° 30′ E. long., being about 650 miles in extreme length; but, as it has no definite limits southwards, no computation can be made of its breadth or superficial extent. This region corresponds very nearly to the Roman provinces of Numidia and Mauritania Cæsariensis. In the beginning of the sixteenth century the Moors of the country called to their assistance against the Spaniards a famous Turkish corsair, Baba Horush (Barbarossa of the Franks), who made himself master of Algiers; and, at his death in battle in 1518, left it to his brother Khair-ed-din (Hyraddin.) The latter, in order to secure his conquest, put himself under the protection of the Ottoman Sultan, Selim I., who appointed him Pasha and Regent of Algiers, and sent him a body of janisaries. In the course of time the governors became independent princes, with the title of Dey, elected by the Turkish soldiery, whose numbers were always kept up by recruits from Constantinople and the Levant, and who formed a very licentious and turbulent aristocracy. For three centuries the Algerines carried on a piratical warfare against Christendom; but at length in 1830, a French army invaded Algiers, took the city, dethroned the Dey, and latterly expelled all the Turks. The French Government still retain their conquest; but their influence and authority extend very little beyond the districts immediately adjoining to the cities and towns which they have garrisoned. They have upwards of 70,000 troops in the country; since the first invasion in 1830 about 50,000 have been slain, and about 10,000 are constantly in the hospitals. Great numbers also die of fatigue and privation. When they march each soldier carries about a hundred-weight, which, under a burning sun, is an oppressive load; and as they are employed in fighting and skirmishing night and day, sometimes within a few miles of the city, few return home except as invalids. The expense of retaining this conquest is enormous; and must be attended with great sacrifices on the part of the mother country. The French, however, have possession of all the coast from Bona to Oran.

Under the Deys the regency was divided into four provinces: 1. Al Jezirah or Algiers proper; 2. Titterie, to the south; 3. Constantina, to the east; and 4. Mascara, to the west; the last three being governed by beys, while the first was governed directly by the Dey himself. At present Abd-el-Kader rules over a great part of the late beylicks of Oran and Titterie, including Mascara and Tremecen; Achmet possesses the greater part of Constantina; while the country actually possessed by the French forms three military governments. The first, that of *Algiers*, under the command of the governor-in-chief, comprises, besides the city, a circuit of about three leagues and a half without the walls; and it is only within this space that the French rule is positively established, and their colonists in

safety. The second, called the *Government of Oran*, contains a territory of from 15 to 20 leagues land; but the governor has great influence over the neighbouring country. The third, called *Government of Bona*, includes that town and Bougiah, with their respective territories: to which may now add Constantina, and the road between that city and Bona. Besides these recent conquests France has possessed for four centuries a territory called the *Concessions*, which extends along coast from Bona to the frontiers of Tunis, and is composed of two distinct parts: the eastern which stretches from the frontiers of Tunis to the river Seibous, which belongs entirely to France; and on which are situated three forts, called the *Bastion de France*, *Al Kalah* or *La Cale*, and *Bastion de Marsa*; the western, which extends from the Seibous to Bougiah, along the coast of which the Dey had granted to France the right of fishing for coral, in consideration of a certain annual rent, which was latterly, by treaty in 1817, fixed at the amount of 200,000 francs. In 1825 the fishery employed 200 boats, amounting to 1791 tons, and manned by 1968 men, and the produce was valued at 2,400,000 francs. The crews of these boats were Italian, but they all paid a duty to France. In the forts of Mont Genoua and La Calle were detachments from the troops of the Dey; and, in return, the French consul was to be paid a duty of two per cent. on the exports and imports of the kingdom at the same time.

The territory south of the Atlas is included in the late regency, consists of two extensive districts, the *Province* or country of the *Beni Mozab*, about 300 miles to the south of Algiers; and the *Wadreer* or *Desert*, as far to the south of Constantina, both of which stretch to the very edge of the desert. Both are destitute of productions of both districts. The Zaab is well watered by the river Ajedi; the country adjacent to the Wadreer is very dry. There are no fountains or rivulets; and, as the only water to be procured is by the boring sometimes of 100 fathoms, through different layers of sand and gravel, to the bottom of a flinty stone-like slate, which is known to be immediately above the *Eighth and last Water-bearing Stratum*. This stone is easily broken through, and the flow of water which follows the stroke is so sudden and abundant, that the person let down for the purpose is sometimes drowned, if he is not taken up with the greatest expedition.

Algiers, the capital of the late regency, and now the capital of the French territories, is situate on the coast of the Mediterranean, in 36° 47′ 20″ N. lat., and 3° 4′ 25″ E. long. It is built in the form of a hall which rises to the height of 400 feet, the top being occupied by the kasbah or castle. The streets are very narrow, the widest having been only about 12 feet, till the French formed a road through the city. The houses are in the usual Moslem fashion, all square, without chimneys, and flat-roofed; and as they rise in rows above each other on the hill-side, they form a kind of terrace, which has not a view of the sea. All the houses are whitewashed on the outside, and have the appearance of forts, batteries, and city walls, the whole having the appearance, at a little distance, of a vast chalk quarry open to the view of a mountain. Towards the land the city was formerly defended by a wall flanked with towers; but, towards the sea, there was a line of forts and batteries, mounting 87 pieces of cannon. The city contains 15 streets, 14 blind alleys, and 5 open places; but, with the exception of one or two streets, it is a confused labyrinth of narrow, gloomy, and crooked lanes. It is, however, well drained by sewers, and well supplied with water, which is conveyed from the neighbouring heights by four aqueducts, and supplies 64 public wells. Before the French conquest there were 16 great mosques, with minarets, and about 50 small ones. The whole town is very curious, as a specimen of Arab and Moorish taste in architecture, to which has now been added a mixture of French, about a fourth part of the old town having been pulled down to make room for fine houses, shops, and hotels. The harbour is formed by the island *el jezirah* from which the city takes its name, and which is now connected with the mainland by a mole; it is principally an artificial island that the fortifications and batteries were erected. On the land side the only defence was the emperor's fort, which no longer commands the city, but is itself commanded by the upper part of Mount Bougharah. The hills which rise above and around the city are studded with country-houses, gardens, vineyards, and holiday groves. Algiers has also three colleges for the instruction of the ministers of the Moslem religion, and schools are established in public halls, where children of both sexes are taught to read and write. A free school has been established, and a public library. The Mosque of Mohammed Dey, built 200 years ago, is a splendid edifice. The census of the city is little more than twenty years old; population has since very considerably increased, some accounts have carried the amount to 150,000 or 200,000. According to the census taken in 1829, it was found to contain 11,500 houses, 1,000 shops, 3,000 warehouses, 1,000 cafés, 30 baths, 30 fountains, 10 mosques, 10 churches, and 5 synagogues, in all 5,555, besides the garrison. Algiers was first built about the year 936, by an Arabian chief named Yussuf Zeri. Fourteen Beys were sent to the city from the bay of Smyrna, and Hassan Pacha, who was the French army landed in 1830, found the country all around Algiers in a state of high cultivation, and the Turks had introduced many great improvements in the construction of the city and harbour, and in the public buildings.

Constantina, or *Kostantinah*, a large and very ancient city, 85 miles S. by S. of Algiers, occupies a remarkable situation, and is at all points, except one, admirably defended by natural fortifications. A ravine or gap as well as of great depth, at the bottom of which runs the Wady Rummel, separates, as a vast and romantic scarp, a perpendicular rock equally unassailable by bombardment and mining; and which communicates with the adjoining plateau of Mansoura by a very narrow bridge, defended by a double set of great strength. The greater part of the houses are built from two to five feet above the ground on large square cut blocks of dark grey calcareous stone, the remains of ancient building; and are covered with sloping tiled roofs, which give the city the appearance of a Spanish rather than of a Moslem town. None of the mosques, public buildings, or houses are remarkable for any beauty or architectural elegance. The Bey's new palace, built 20 years ago, is large, and in the interior very handsome. The city measures nearly 2700 yards in circumference, and is surrounded by walls, built of Roman-wrought stones. The population may be estimated at from 25,000 to 30,000, a considerable portion of which appears to have been before the French conquest very wealthy, and to have indulged in habits of luxury. The principal manufactures are those of saddles, bridles, boots, slippers, and garters. A considerable trade was formerly carried on with the south, from which, in return for corn, saddlery, and European goods, the Constantinians received gold-dust, ostrich feathers, slaves, and the finer sorts of hides, both of wool and silk. The city received its present name from Constantine the Great, who caused it to be rebuilt; its most ancient name was *Cirta*, and it is celebrated as the capital of the ancient Numidia. In order to form a communication to Constantina with the sea, at the nearest point of the coast, a new city, named *Philippeville*, has been founded on the Bay of Stora, and is rapidly becoming a place of importance.

Bona, called by the Arabs *Bonah*, or the place of jujubes, is situate on the coast, 93 miles N.E. by E. of Constantina in 36° 53′ 30″ N. lat. and 7° 24′ 38″ E. long. The town was destroyed in 1832, but is now rebuilt. Many good houses have been erected, and good shops, reading-rooms, coffee-houses, restaurants, and even a theatre established. Several of the streets have been widened, and carried in straight lines. About a mile S. by W. are the ruins of the ancient *Hippo*, the bishopric of St. Augustine. *Bougiah*, *Bugiah*, or *Bujeiah*, is a considerable place with a few stone houses, mostly streets, on the slope of a hill rising from the sea, with a spacious but insecure harbour. It is 40 E. of Algiers. *Bahara* or *Oran*, a town of 25,000 souls, S. by W. of Algiers, stands on the side of two hills separated by a great wooded valley watered by a rapid stream which flows into the sea. It was built by the Spaniards, and is surrounded with good walls and ditches. The east side is defended by the citadel, two forts, and a battery; and the valley is commanded on the north and west by five strong towers, besides fort St. Philip. Mers-el-Kebir, or Mers-el-Kebir, with safety only before the

town, and this merely in calm weather, or when the wind blows from the south. The inner harbour, which was of considerable size, and intended for sheltering small craft, fell in, in November 1835. *Arzaw (Arzeou, Arzew)*, the *Portus Magnus* of the Latins, a small town of 500 inhabitants, 24 miles E.N.E. of Oran, has productive salines, and is the best harbour in the regency. *Belidah (Blida)*, 30 miles S.W. by S. of Algiers, was lately a flourishing town of 15,000 inhabitants, but was entirely destroyed by an earthquake in 1825; and, though afterwards rebuilt, has been reduced by the effects of war to a population of 4000. *Medeya (Mehdyah, Medea)*, 13 miles S. of Belida, a pretty town of 6000 inhabitants, and situate in a delightful and fertile country, is the residence of the Bey of Titteri. *Masvara*, the residence of Abd-el-Kader, and containing about 10,000 inhabitants, was taken by the French in 1835, and reduced to a heap of ruins; 50 miles E. by S. of Oran. *Tremecen (Tlemecen, Tlemsihan, Tremezen)*, the most considerable city of the province of Oran, has a population of above 10,000. *Tuggurt (Tequort)*, the capital of Wad-reag, 325 miles S. S. E. of Algiers, is a large town of 4000 houses, surrounded with walls and gates, and a wide ditch crossed by three bridges. The people are wealthy; the country produces dates, figs, raisins, pomegranates, apples, apricots, peaches, and other fruits. There is a salt-bed at Tuggurt; and indeed the whole country abounds with this mineral: there are no stones to be met with, but springs of water are numerous. The people are black; but one quarter of the town is possessed by a white race called Muhedjerin, who were once Jews, but to escape death, made profession of Islam, and are now devoted readers of the Koran. They possess great wealth; their women appear in the market-places veiled, and converse in Hebrew among themselves when they wish not to be understood.* *Ghardaieh* or *Ghardeyah*, the chief town of the Beni Mezzab, 360 miles S. by W. of Algiers, contains 2400 houses, including mosques, with a large market-place, and two minarets. It is surrounded by a wall with two gates; and the water is entirely procured from wells. The Beni Mezzab are a powerful people, and speak the Berber language. They are of very white complexion; when they ride they use camels; and their food consists chiefly of flesh and milk; the country yields no grain, though the Wady produces dates. They are Moslem dissenters, are very temperate, and neither smoke tobacco, nor drink wine. They make, however, incursions into Soudan, and carry off slaves, and other property. *Eghwaut* or *Aghwath*, a large town of about 5000 inhabitants, 260 miles S. by W. of Algiers, is surrounded by a wall with fortifications. It has four gates, and four mosques, but no minarets, and the houses are built chiefly of clay or mud; the town is divided into two parts by the river *Emzee*. The region is very mountainous. To the northward is a very high mountain called *Jebel-Amour*, which contains 100 springs of water, and furnishes every kind of timber.

TUNIS extends along the coast of the Mediterranean, and is about 450 miles in length, from N. to S., by 150 in breadth, containing an area of 52,000 English square miles. It is bounded on the north and east by the Mediterranean Sea, on the west by Algiers, on the south by the undefined limits of Biladul-jerid and Sahara, and on the south-east by Tripoli. This territory was formerly a province of the Ottoman empire; but came at last into the possession of a hereditary Bey, who is now the actual sovereign, and exercises despotic power. His military force was recently organized on the European system by a British officer, and he has long maintained peaceful relations with the European powers. The Mamelukes or body-guards form here a separate class, which is not numerous, but is on that account the more powerful; they form the nobility or aristocracy of the court, and being all assembled round the person of the sovereign, and in his special service, they are considered as enjoying his peculiar favour. *Tunis*, the capital, is a large but irregularly-built city, with narrow and filthy streets, situate on the west side of a shallow gulf, which communicates with the Mediterranean Sea by a narrow entrance, named the *Goleta*. It has high ground to the south, but an extensive marsh on the west, and yet is not unhealthy. The citadel, called *El Gaspa*, is on the west side of the city, but is completely commanded by the neighbouring heights. The Bey's fortified palace, named *El Bardo*, is about two miles N.W. of the city. The Goleta is well fortified, having its entrance defended by a castle of the same name; and, besides, the depth of the bay or lagoon inside being nowhere more than a fathom, ships cannot approach the city. Tunis carries on a more extensive trade than any other city of Barbary; its population exceeds 100,000, of whom 40,000 are Jews, and of these about 600 are tailors, and 1000 goldsmiths. On the sea-coast, north of the Goleta, and 13 miles N.E. of Tunis, is the site of the ancient city of *Carthage*, of which nothing is left but heaps of stones and remains of walls, with some cisterns and subterranean vaults. *Keruan* or *Kairwan*, 80 miles S. by E. of Tunis, a large town, with 60,000 inhabitants, holds the fourth place in point of holiness in the Moslem world; an honour which it owes to the circumstance of its containing the tomb of the friend and barber of the prophet, which is placed within a large mosque, said to be supported by 500 granite pillars. The mosque is surmounted by beautiful cupolas and towers; but being surrounded by a high wall, it has more the appearance of a citadel than of a church. Kairwan was long the metropolis of the Arabian empire in Africa, and the seat of science; but at present it is famous only for its sanctity, and its shoemakers, whose morocco boots are considered as the best in Barbary. Nothing can be more naked and lifeless than the environs of the town, as far as the eye can reach. South-east of Kairwan, 30 miles, are the remains of a magnificent amphitheatre, still very entire, at a place called El Jemm, the ancient *Tysdrus*; and 85 miles S.W. by W., at *Sfetlah* or *Sbeitlah*, are the fine ruins of the ancient *Sufetula*. *Sfakus* or *Sfax*, on the south-east coast, is a considerable town, with a flourishing trade, and surrounded by 50,000 gardens, of which 14,000 are attached to the houses. To the eastward are the *Kerkina* or *Karkena* islands (anc. *Cercina*), *Gerba*, *Ramlah*, and *Kousha*. The group extends about 30 miles in length N.E. and S.W.; they are all very low, and covered with date trees, but otherwise not remarkably fertile. *Khabz*, *Gabs*, or *Cabes*, on the south-west shore of the Little Syrtis, at the mouth of a rivulet, the famous *Tritonis* of the ancients, but now chiefly valued from its watering extensive plantations of henna, which afford a valuable article of export. Khabz is a large town, with 20,000 or 30,000 inhabitants; but its harbour is now accessible only for small vessels. *Bizerta* or *Benzart*, a large town, about a mile in circumference, with about 8000 inhabitants, on the sea-coast, 40 miles N.N.W. of Tunis, represents the ancient *Hippo Zarytus*. To the south are two large lakes, joined by a strait, and connected with the sea by a broad channel flowing through the town. The harbour is small, and the most dangerous on the coast; three or four miles off the shore are the *Fratelli* or *Brothers*, two immense rocks, which rise 300 feet from the sea. The other principal places are: *Porto Farina*, at the mouth of the river Mejerdah, 27 miles N. of Tunis; *Hammamet*, on a wide gulf to which it gives its name, on the east coast, south of Tunis; *Sousa*, and *Mistir* or *Monaster*, on the coast of the gulf of Hammamet; *Ghafsah*, *Nefta*, and *Tuzer*, on the south-west frontier, west of the Little Syrtis; *Mahadiah* on the coast, east of Kairwan.

TRIPOLI is a narrow territory which extends along the coast, from the frontier of Tunis to the frontier of Egypt. The habitable part consists chiefly of portions of the coast, which for a few miles inland are generally fertile and well cultivated; but in some places the desert approaches close to the sea; and the interior is little better than a barren and sandy waste, occasionally traversed by rocky ranges of hills. It was for upwards of a century governed by a series of hereditary bashaws, of the

---

* Notes of a Journey into the Interior of North Africa, by Hadji Ebn-ed-din El Eghwati, translated by W. B. Hodson, Esq. *London*, 1830.

Moorish family of Karamanli, who acknowledged the sovereignty of the Ottoman Sultan, and paid the tribute, but were in other respects the independent sovereigns of the country. In 1835 Tripoli was recovered for the Sultan by his Capudan Pasha, and is now again one of the provinces of the empire. *Tripoli*, the capital, stands on a low neck of land, on the shore of the Mediterranean, in 32° 53' N. lat. and 13° 13' E. long. It is surrounded by an extensive wall, but a large portion of the inclosed space is unoccupied. The caravansaries, mosques, bazaars, houses of foreign consuls, and of the better class of citizens, are generally built of stone, and regularly whitewashed twice a-year; they are usually two storeys high, but not equal to those of the same class in Tunis and Algiers. The population does not exceed 25,000. Tripoli carries on a considerable trade with the interior of Africa, to which it may be considered one of the principal shipping ports; and its bashaw used to exercise considerable influence over Fezzan and the tribes of the adjacent deserts. Close to the city are a fine Roman triumphal arch and other antiquities. Along the coast E. and W. of the city, between the two Syrtes, are the inconsiderable towns of *Zaouh* or *Ezzaouh*, *Lebidah* (ancient *Leptis Magna*), and *Mesurata* or *Misurata*. To the eastward of the Great Syrtis is the dependent province or beylic of *Barca*, the principal places of which, likewise on the coast, are: *Bengazi* (ancient *Berenice*), with 5000 inhabitants, in the midst of a small fertile district, watered by a rivulet; *Teukera* and *Dolceta* (ancient *Ptolemais*), once flourishing towns, but now reduced to insignificance; and *Derna* or *Beled al Nasr*, the residence of the Bey, a town with 4000 inhabitants, on the north-east coast. But the most interesting place in the district is *Grennah* or *Kurin* ancient Greek *Kurenè*, Latin *Cyrene*, the ruins of which are finely situate on a high table plain, which descends abruptly to the sea by successive stages. The most remarkable of the remains is the necropolis or burying ground, consisting of tombs arranged in terraces along the mountain, and extending a mile and a half along the roads which lead to the city, so as to present the appearance of splendid streets. *Kurene* was founded by the ancient Greeks, and was for a long time one of their most flourishing colonies, but is now completely deserted. In the southern part of Barca is the district of *Augela*, with a town of the same name, which derives some importance from its being one of the stages on the great caravan road between Egypt and Fezzan.

ES SAHARA, or THE DESERT.

The Sahara extends, as already mentioned, across the breadth of Northern Africa, from the valley of the Nile westward to the Atlantic Ocean, and from Bilad-ul-Jerid southward to the borders of Soudan. This wide region is covered more or less extensively with a quartzy and calcareous sand though in some places the surface is composed of naked clay or bare rocks; fertile tracts also occur, but they are few and far between, and also lakes, strongly impregnated with soda, forming the natron and salt lakes mentioned by travellers. In the eastern parts of the desert the rocks are chiefly of the secondary formation, as limestone, sand-stone, gypsum, and rock salt, occasionally traversed by trap rocks; along the western seacoast they are said to be principally composed of igneous rocks, and chiefly basalt. The greater portion, indeed, of this vast space is one mass of bare rocky hills, and scorching sands, without water, bird, or tree, or even the appearance of vegetation. Here and there, however, there are to be found scattered over it fertile spots called wadys, wahs, or oases, which contain wells of good water, and a considerable portion of tropical vegetation. These are most numerous about the middle of the desert, extending southward from Tripoli to Bornou, and consequently that part of it is the most frequented by travellers. To the westward the desert becomes more cheerless and forbidding, the watering places are at a greater distance from each other, and the vegetation which they contain is more scanty. The wells frequently become dry, which occasions scenes of horror and misery that exceed all description; men and camels, disappointed of water, die in hundreds and thousands. This western portion is also more sandy than the middle, and is consequently not only more subject to the fearful simoom, but also to furious tempests of wind which roll the sands before them like the waves of the sea. To such a degree, indeed, are the sands heated by the unclouded glare of the sun, and to so great a degree of fineness are they reduced by constantly shifting about, that the atmosphere for upwards of a month is constantly charged with the particles; and to a great distance westward in the Atlantic Ocean ships often find the sails choked with them. This portion of the desert may be pronounced to be almost destitute of inhabitants; except where the scanty vegetation, in certain spots, affords pasturage for the flocks of a few miserable Arabs, who roam from one well to another. In other places, where the supply of water and pasturage is more abundant, small parties of Moors have taken up their residence, and live in independent poverty, secure from the tyrannical governments of Barbary. But the greater portion of the desert, being entirely destitute of water, is seldom visited by any human being, unless when the trading caravans thread their weary route across it. In some places, however, the ground is covered with low stunted shrubs, which serve as landmarks for the caravans, and furnish a scanty forage to the camels. Elsewhere, the unfortunate wanderer, wherever he turns, sees nothing but a boundless expanse of sand and sky, a gloomy and barren void, where the eye finds nothing to rest upon, and the mind is filled with painful apprehensions. In the midst of this solitude the traveller sees the carcasses of birds which the violence of the wind has brought from happier regions, and, as he commences on the fearful length of his remaining journey, listens with horror to the voice of the driver of the blast, the only sound which breaks upon the awful silence of the desert.—(*Cirilo.*)

The wild animals that inhabit these dreary regions are the antelope and the ostrich, whose swiftness of foot enables them to reach the distant watering-places. On the skirts of the desert, where water is more plentiful, are found lions, panthers, elephants, and wild boars; but the only tame animal that can bear the fatigue of crossing the desert is the camel. The desert is traversed in various directions by numerous routes, varying in length from 30 to 80 days, which terminate at the principal cities and towns of Soudan and Barbary, but deviate from the straight course in several instances, according as trading towns or wadys lye nearly in the way.

The Sahara is inhabited by numerous tribes of various lineage, which are scattered in its wadys and fertile spots. *Moors* occupy the coast of the Atlantic between Morocco and Senegal, and extend eastward to the limits of the Touaricks. They are subdivided into a great number of tribes, most of whom are distinguished for ferocity and love of plunder. They consist partly of pure Arabs, whose ancestors migrated from Arabia in the first centuries of the Heirah, and partly of a mixed race, descended of both Arabs and Berbers. The pure Arabs may be classed in two principal groups; the one of Himyaritish origin, and bearing the name of *Hel'el*, *Hel'i*, or *Hel'il*; the other of Kahtanian origin, and bearing the name of *Maghegh*, *Mak'il*, or *Magelli*. Of the Helal the best known tribes are the *Beni-mori* and *Mahamid*, who live near Cape Bojador, and the *El Hharits*, in the neighbourhood of Darah. To the latter may be annexed the tribes of *Tekna*, *Mesfat*, *Moghafera*, and *Ignaoua* with some others. Among the Maghylah the most distinguished tribes are those of the *Sahara* or *Welad-Bu-Sebi*, and *Delemy* or *Welad Delem*, who all dwell near Cape Blanco, and are notorious for their cruelty. Of the same lineage are the tribe of *El Wedeyah* who possess the oases of *Bu-Tilis* and *Beldah*; the tribe of *Barisseli* or *Berakeh*, who possess *Tabelbelt*; the tribes of *El-Bouyat*, *Arkenat*, and several others.

To the class of mixed Moors belong the numerous tribes who are confounded under the common name of Shawiah, but are distinguished by the particular names of *Tenezah*, *Berakuah*, *Douai*,

&c. In the Terarzah are comprised the *Walad-el-Haji-Darmako*, who border on the Senegal; the *Adjounah*, robbers who infest the adjoining coast; the *Walad Mobarek*, who dwell in the interior, and a number of other tribes. In the Beraknah groupe are the *Walad-Amar* or Moors of *Ludamar*, the *Gegebah*, the *Takant*, and many others. In the groupe of Douish are comprised the *Walad-Ghayn*, better known by the name of *Walad-Abou-Seyf*; the *Kountah*, and, perhaps, also the *Zuat*, who occupy the country towards Arawan. To the same mixed class belong the LAMTHAH, comprising the tribes of *Walad-Nun*, who inhabit *Wady-Nun*, to the south of Marocco; the *Masoufah*, who formerly worked the salt mines of *Tahasay* or *Tegazze*, which are now abandoned; and, perhaps, the *Warkalan*, who possess the desert adjoining Bilad-ul-jerid, and who appear to be now the possessors of *Tuat*, from which they derive that name.

The *Tuaricks* are a numerous and warlike people who inhabit the middle portion of the Sahara, between Tripoli, Timbuctoo, and Bornou; and have from the days of the Carthaginians and the Romans furnished the conductors of the caravans, and even the merchants who carry on the regular and active commerce which has always existed in this part of Africa. They are a fine race of people, tall, erect, and handsome, with an imposing air of self-respect and independence. Their skin is not dark, except where browned by the sun. They hold in contempt all who live in houses and cultivate the ground, and derive their own employment and subsistence from the pasturage of their flocks, trade, and plunder. They keep all the borders of Soudan in constant alarm, and carry off thence great numbers of slaves, whom they sell in Barbary. Yet, at home, they have been found frank, honest, and hospitable, paying an unusual respect to their women, and in their social life much resembling Europeans. They have even written characters, which they have cut on the dark rocks that chequer their territory. The principal tribes are: The *Hhagara*, who occupy the country between Twat and Arawan, and likewise possess Ahyr or Hayr, and have *Wallen* for their capital; they are notorious for perfidy and cruelty: the *Sourka*, who extend from Mabrouk to Jinnie, and subject all their negro neighbours to insolent exactions: and the *Taghama* and *Kolluri* to the north of Haoussa, the latter of whom possess the oases of *Asben* and *Ghat*, with the whole desert as far as Fezzan. Of all the tribes those of Hhagara and Matkara are the least black, having only a brownish or tawny tint; the others have complexions of darker shade in proportion to their vicinity to the negro races, with whose blood they have mixed.

The *Tibboos* or *Tibbos*, who are found in the eastern part of the desert, are nearly as black as negroes, but have a different physiognomy; their hair is longer, and less curled; their stature low; their features small; and their eye quick. They live on the milk of their camels, and the scanty produce of a few fertile spots; to which they add the profits of a little trade, and not unfrequently the plunder of caravans. They are themselves, however, exposed to a mightier race of spoilers, the Tuaricks, who, once a year at least, make a foray into their territory, and carry off every thing, without resistance from the cowardly Tibboos, whose only safety is to ascend certain perpendicular rocks with flat tops, beside which they take care to build their towns. They are nevertheless gay and thoughtless, delighting, like other Africans, in the song and the dance. The principal tribes are: The *Tibboos of Bilma*, between Fezzan and Aghaden, whose capital is *Bilma*, a mean town, built of earth, but having in its vicinity two salt lakes, from which immense quantities of salt are gathered, and taken to Soudan. To the south of Bilma is a desert of 13 days' journey in extent, perhaps the most dreary tract on the globe; it contains not a drop of water, nor a vestige of animal or vegetable life. *The Tibboos of Gonda* possess Aghaden, and have thousands of camels; they are notorious plunderers of the caravans; but of late have become more commercial and industrious, an improvement which they owe to their intercourse with the merchants of Tripoli. They seem to be the most numerous of all the tribes. *The Tibboos of Traila*, to the south of the Gonda; those of *Borgou* or *Birgou*, whose chief place seems to be *Yen*. The *Tibboos of Reshadeh* or of the Rocks, so named from several of their tribes living in caverns in the mountains of Tibesti. *Abo* appears to be their chief town. The *Tibboos of Arna*, so called from their chief town of the same name. But the Tibboos have not the exclusive possession of the Eastern Sahara: to the north Barca is possessed by Arabs, the best known of whom are the *Hharabyn* and *Oulad Ali*; and the series of oases which it contains along the borders of Egypt are inhabited by Berber races. To the south wander the Arab tribes of *Beni-el-hasan Doghanah*, *El Asula*, and *Salamat*; to the east the mixed Arab-Berber tribes of *Lawatah* and *Berdawah*. The middle region only belongs to the Tibboos.

The Sahara, as already mentioned, contains a number of fertile spots or *wahs* (anc. *oasis*). Of these we have already described those that border on Egypt, and acknowledge the supremacy of the Pasha—(see EGYPT). Of the others, the principal and most important are those of *Fezzan*, *Ghadamis*, *Asben*, and *Tuat*.

Fezzan lies immediately to the south of Tripoli, and is a very large oasis, being about 300 miles in length, by 200 in breadth, but scarcely distinguished from the desert, as it does not contain a running stream of the least importance. Water, however, is abundant under ground, and by raising it in wells the inhabitants have formed a number of fertile spots in which dates and grain can be reared, and where a few asses and goats, with numerous camels, are fed. The people are chiefly dependant on the trade that passes through Fezzan, which being situate midway between Egypt and Marocco, and between Tripoli and Bornou, is the point where numerous caravans cross and meet. There are also merchants in the place itself, who carry on very extensive concerns; and, from these resources, Fezzan is able to maintain a population of about 70,000. It is governed by a sultan, who is tributary to the Pasha of Tripoli; his capital is *Mourzouk*, a considerable town in a low and unhealthy, but well watered situation, which is the chief seat of the trade. *Germa*, the ancient Roman capital, is now much decayed, but still contains some monuments of its former consequence. *Zuila*, *Temissa*, and *Gatrone* are small towns on the western frontier. *Traghan*, in the south, bordering on the desert, is an industrious place, with a thriving manufactory of carpets. *Sockna*, in the desert to the north, on the road to Tripoli, forms a great caravan station.

Ghadamis or *Gadamis*, an oasis to the north-west of Fezzan, derives some importance from the passage of the caravans from Tripoli and Tunis to Timbuctoo, though these are not so considerable as those which pass through Fezzan. The chief town, which is of the same name, 240 miles S.W. of Tripoli, is divided between two hostile tribes, each enclosed by a separate wall. Ghadamis and the surrounding villages exhibit many traces of having been occupied by the Romans.

The principal oases belonging to the Tuaricks are: *Ghat*, whose inhabitants form a sort of oligarchical republic; in its chief town, of the same name, is held a great annual fair, which is much frequented by the tribes of the desert; *Ahir*, a large and fertile oasis, but little known; *Mahrouk*, small and unimportant; *Asben* is one of the largest, and its capital, *Aghades*, is said to be as large as Tripoli: it is at least one of the principal commercial marts of the Sahara.

In the western desert are the oases of *Tuat*; *Hoden* or *Wadan*; *Tisheet*; *Taudeny*; *Taghaza*; *Arawan* or *Aroan*; and the two *Walata* or *Gualata* and *Walet*. *Tuat*, 850 miles W.S.W. of Tripoli, is very extensive; it is inhabited by mixed Arab-Berber tribes; its chief town is *Aghabby*. It also contains the town of *Ain-el-Salah*, visited by Major Laing, which derives its name from certain holy wells (*Ain*). *Hoden*, *Tisheet*, and *Taudeny*, are celebrated for their mines of rock salt. *Arawan* contains a town with 3000 inhabitants. *Gualata* and *Walet* are often confounded, though quite distinct; the one being situate on the route between Senegal and Marocco, and belonging to the Wodayn; the other on the road to Timbuctoo, and possessed by the Berabysh. The only place of note on the

the north-east, north-west, west, and north, forming the watersheds of numer
elevation and physical character nothing is known. At the north-east angle o
Mountain of Cameroons rises to the great elevation of 13,000 feet, close to the s
the commencement of a range of volcanic hills, which extend to the north-eas
tains of Mandara, visited by Denham, and are probably a portion of the grea
are said to extend across the middle of Africa, and supposed to be continuo
of Kong; but nothing is known of them except the name.

RIVERS AND LAKES.—The great river of Soudan is the *Kawara*, *Quorra*, or *Ni*
part of its course *Joliba*. So far as yet known, its principal source seems to
Mount Loma, 250 miles E. by N. of Cape Sierra Leone. It flows first in a nort
about 600 miles, then almost due north for 180 miles, forming in its progress
Dibbie; it then turns again to the north-east, but, from Timbuctoo to Ya
miles, its course has not yet been explored. From Yaouri, 570 miles from the s
navigable stream, south, south-east, and lastly south-west into the Bights o
22 mouths, of which the principal are the *Formosa* or *River of Benin*, the *Ware*
and the *Old Calabar*.

Within a very short distance of its source it is already navigable, and at
scribes it, "as broad as the Thames at Westminster," that is, about a quarter
pal known affluents are, the *Cubbie* or *Cobbie* or *Quarrama*, which passes Sacca
Kadunia, a large river from Nyffe; the *Tshadda*, which passes Funda, and
a very large river, reputed by the natives to be identical with the *Shary*, one
Tchad; but which more probably has its sources only on the opposite side o
The course and termination of this great river long formed one of the mo
phical problems. Herodotus relates in his history (Euterpé, 32) a few particu
the interior of Libya by five young Nasamones, who arrived at the banks of a la
west to east, and containing crocodiles. Beyond this scanty information t
Roman geographers seem to have known nothing; and even the tables of Ptole
"very large rivers" in the interior by the names of *Gir* and *Nigeir*, still r
puzzle to his successors. The detailed descriptions of these regions given by the
historians of the middle ages are still more perplexing. On their authorit
vague reports of the natives, the Niger or Nile of the negroes was considered
during the 16th and 17th centuries, as having its course from east to west, ar
stream of the Gambia and the Senegal. Others made these two rivers and t
common source, the Lake Maberia, in opposite directions; the Niger being n
across Africa, to join the Egyptian Nile. In fact nothing certain was known
dispel the mystery in which it was involved was the principal object of Park's
first journey he reached it at Sego, and found it "flowing slowly to the eastwa
was to discover its termination. Park perished in the attempt; and geographe
themselves to no purpose, till its issue in the sea was proved by the Landers in 1
and Boussa the river is divided into numerous channels by rocks, sand-banks, ar
with tall rank grass, some of which the Landers found to be so shallow, that their
grounding; but they were told, at Yaouri, that above that place, and below B
was not interrupted by rocks or sand-banks; and that, after the wet season, ca
to and from Yaouri, Nouffé, Boussa, and Fundah. At Boussa black rocks r
middle of the stream, its waters are tossed in whirlpools, and in the dry season
not more than a stonecast across. Sailing downward from Boussa the river
pletely navigable to a finely wooded island called Patashie, below which for 20
so full of rocks and sand-banks as to render the passage very difficult. After this
its farther course to the ocean, the Kawara is a broad noble stream, varying in
to six, but being commonly between two and three, thus forming for several hun
more resembling a lake or an inland sea, than a river. Its numerous branches fo
extends 300 miles along the coast, and contains 25,000 square miles, of a dre
surround with thick fine fruit groves, and [illegible] with orange and li

with Africa. The best entrance yet known to the main body of the river, is by the branch commonly called the Nun, but even that branch is not navigable during at least six months of the year; while, during the remaining six months, steam-vessels only, and those of a very light draught of water, can accomplish the navigation. At Lever near Boussa, the bed of the river becomes so contracted and obstructed with rocks that the progress upward is stopped.

The *Senegal* or *Zanaga* rises near Timbo or Tecmbo, 216 miles N.E. of Sierra Leone, where it bears the name of *Ba-fing* (black river). It flows first northerly, and then westerly, into the Atlantic Ocean, 100 miles N. of Cape Verde. It receives a great number of affluents in the upper part of its course, but very few in the lower part. The principal of these are: the united stream of the *Kokoro* and *Ba-Wolima*, from Manding: the *Faleme*, from Bambouk and Sadadoo; the *Nerico*, which flows from a small lake named *Tiali*, and which, in the wet season, communicates with the sources of another river Nerico, an affluent of the Gambia; and the *Sakham*, from *lake Kayor*, near the west coast. In the lower part of its course the Senegal forms a number of large islands, but ultimately reaches the sea in a single stream. It is navigable for several hundred miles, and the length of its course is about 950 miles.

The *Gambia*, under the name of *Diman*, has its source in the plateau of Fouta-Toro, and has a north-westerly course of 700 miles into the Atlantic Ocean, which it reaches 100 miles S.S.E. of Cape Verde. The navigation is uninterrupted from the sea to the falls or rapids of Baraconda, a distance of about 400 miles, above which sand-banks and flats render it difficult; while the crowds of crocodiles and river horses in the water, and of other wild beasts on the banks, render it alarming, and even dangerous. Along the coast to the south of the Gambia, are several large rivers, the courses of which are not yet well known, and some of which are said to communicate with each other and with the Gambia by their branches: these are the *Casamansa*, the *Cacheo*, the *Jeba*, and the *Grande*.

Proceeding along the coast are a great many other rivers, which it is sufficient merely to name in their order from west to east:—*Campoomee, Nunez, Ponga, Dembia, Debroka* or *Sangaria, Mahniah, Morebiah, Tannah, Mellacoree, Great Scarcies, Little Scarcies, Rokelle* or river of Sierra Leone, *Kates, Karamanka, Cockboro, Yallucka, Bagroo, Jong, Boom-Kittam, Gallinas, Solyman, Manna, Pissou, Cape Mount, Half-Cape Mount, Po, St. Paul, Junk, St. John's, Grand Cestos, Rock Sesters, Sanguin, Sinou, Droo, Half-Cavally, St. Andrew, Tabetah, Frisco, Lahou, Sueira da Costa, Assinee, Seenee, Chama* or *Praa, Volta* or *Adiri, Lagos*; the last communicates with the Kawara.

The TCHAD, TJAD, SCHAD, or CHAD, is the largest lake yet discovered in Africa. Its centre lies in 15° E. long., and 13° 30′ N. lat., its length being about 200 miles, and its breadth 150; but during the rainy season its size is greatly augmented, and a broad belt of lowland is overflowed by its waters. It contains a number of islands inhabited by the Bidoomahs, a race of pirates who infest its coasts. Its principal feeder is the *Shary*, which enters the lake from the south-east, and was traced 40 miles upward by Major Denham, who found it to be half a mile broad at its mouth, and to flow at the rate of two or three miles an hour. The *Yeou* enters the lake on its west side, but is a comparatively small river, being only fifty yards broad in the dry season near its mouth, where it was crossed by the British travellers. In direct opposition, however, to their testimony, that the Yeou flows eastward into the lake, Lieutenant Allan and M. D'Avezac suppose that it is really the outlet of the Tchad, and flows southward to join the Tchadda. The Tchad was not known in Europe till the journey of Oudney, Denham, and Clapperton; though it figures in maps of the 16th and 17th centuries as the lake of Bornou. It is probably the *Lybian Lake* of Ptolemy; and on its eastern side there is a valley called *Bahr-el-Gazelle*, resembling the deserted bed of a river, through which it is supposed to have once communicated, and probably still communicates occasionally in great floods, with *Bahr Filtre*, another large lake to the eastward, of which nothing is known but the name.

The coast of Senegambia is remarkably low, and the same flatness extends from the Senegal to Guinea. Immense forests, the unchecked growth of centuries, with underground clothed with the rankest vegetation, exclude the rays of the sun; leaves and herbage fall and rot, perpetually increasing the depth of a sour damp soil. The current of the rivers is sluggish, owing to the slight inclination of their channels, which are generally broad and shallow, and often contain bars someway up the stream; mud is deposited profusely on their sloping banks, and favours the endless multiplication of mangroves. Inland the surface of the country continues monotonously flat, for a considerable distance, to the foot of the first hills, which swell at last into the great range of the mountains of Kong. The general appearance of the coast of Guinea from the sea may be compared, says Mr. Meredith, to an immense forest; highlands are seen in different directions, crowned with lofty trees and thick underwood. On a nearer prospect, and on a strict examination, the valleys will be found in many places richly planted, and extensive plains beautifully studded and decorated with clumps of trees and bushes are also to be seen. As we advance into the country, where there is more moisture throughout the year than on the coast, and where the fertility of the soil produces the most vigorous vegetation, the woods are so stopped up by its luxuriance as to be almost impenetrable; and the surface is hid under a covering of shrubs, weeds, and herbs. The rivers are seen winding in different directions, flowing rapidly in some places, and in others forming stagnant pools.—(*Account of the Gold Coast of Africa, by Henry Meredith, Esq., Governor of Fort Winnebah.* London 1812.) The soil in the vicinity of Sierra Leone consists chiefly of a slight stratum of brown gravel, on a semivitrified rock of the same colour. On the coast of Guinea, from Cape Palmas to the river Volta, the soil, within five or six miles of the shore, is of a silicious nature; the clumps of hills, which are to be met with in every direction, are composed principally of gneiss and granite. Farther inland the sandy soil becomes more and more mixed with decayed animal or vegetable matter, and in the valleys a rich alluvial soil is met with.—(*Martin's Western Africa*, 259.) Water, also, which on the coast is scarce and brackish, becomes in the interior good and plentiful. Farther east the maritime flat country becomes broader than on the gold coast, and extremely fertile, terminating at last with the swampy delta of the Kawara, which is profusely covered with rank vegetation.—(See VEGETATION, in the general description of Africa.)

Of the physical features of the interior of Soudan we are unable to give any general satisfactory account. The western part of the country consists of the basin of the Kawara, bordered on the south and west by mountains, on the north by the desert, and having its eastern boundary formed by a range of hills and high ground which divide it from the basin of the Tchad. The last boundary, supported on two sides by mountains, is probably a table-land of considerable elevation, the lowest part of which is occupied by the great lake; but in that respect, nothing is positively known. Its elevation, however, is certainly not so considerable as to raise it into the cooler regions of the atmosphere; while its situation in respect of the desert and the sea, open to the one, and secluded from the other, necessarily renders the climate hotter than that of the maritime regions farther south and nearer the equator.

The climate of Soudan is tropical; and the maritime region of Senegambia experiences the most intense heat. There are only two seasons, the one of which may be considered as a moderate summer, the other as a continuance of burning dog-days. During the whole year the sun at mid-day is insupportable. The north and north-west winds blow almost without interruption. The east or trade winds are only felt within 100 or 120 miles of the coast; the south wind is very rarely felt. During the great heats a dead calm prevails for about 30 days, which enervates the most robust constitutions. From the beginning of June till the middle of October, sixteen or eighteen heavy rains fall; during

the rest of the year there are heavy dews. At Sierra Leone, farther south, the range of the therm
meter is very small. The average heat is 82°: the rains continue for six months and floods are
but the climate is on the whole as healthy to Europeans as any other tropical climate. From the great
of the east [illegible] at the equator it might be supposed that its climate is hotter than that
parts of Asia, which are nearer the tropics, but this is not the case. It will be found, on the contrary,
that all the [illegible] and about 5° north of it, are the most temperate parts of the
tropics. Africa has less power there than in more northerly or southerly countries because
it [illegible] the tropics. At Bissao, when the sun is at its greatest distance from
the tropics, the heat at sunrise has been found to be 83°, and at Sierra Leone 86°. It
should seem, therefore, that [illegible] at Sierra Leone about 4°. At Cape Coast Castle, 5° N. lat.,
the [illegible] and as high as 93°; but the usual height observed in the hottest months
was from 86° to 88°, and that place is considered the hottest on the Gold coast. To the eastward
of Cape Coast Castle, the heat is never known to exceed 87°; and has been observed as low as
78° at Whydah, in the Bight of Benin, and 82° at Badagry, and may be divided into the wet and the dry; of the latter
however, there are two in the year, one commencing at the end of May or early in June, the other
[illegible] of October or early in November; but the last scarcely deserves the name of wet season,
consisting only of a few days rain, and is succeeded by a very fine season. The rains set in with a violence unknown in
temperate climates, and continue with out intermission for two or three days. The quantity which falls
during each season is immensely great. Low lands are overflowed, and rapid streams are formed
with astonishing force. After this flood the atmosphere clears, and strong breezes commonly blow
the heavy rains are not again expected, though showers fall at the changes of the moon, which
do not so much water as would fall in England from a whole day's rain. About the end of July the
rains are considered to be at an end; and shortly after, the foggy season commences; a season that
may be so called, which is very unhealthy, but the only unhealthy season that is known on the coast.
The commencement of the foggy season is a sure indication that the rains are over: it commences and
terminates about the 15th of August, after continuing two or three weeks. While it lasts the atmo-
sphere is thick and heavy, the sounds are very low, the sea breezes do not blow with their usual power,
and the land winds are scarcely perceptible. The effects of this season are much felt by asthmatic
people and those whose lungs are unsound. The second rainy season is not nearly so violent as the
first; the rains do not fall in the same constant stream, and are not succeeded by fogs. The dry season
commences in November, and continues for the remainder of the year, that is, till May. The
winds are regular and mild. The land winds, which blow from the N. and N.N.W., and the sea
breezes, which blow from the S.W. and W.S.W., prevail, with little interruption, throughout the season.
The sea breeze commences about 9 or 10 o'clock in the forenoon, and declines at six in the evening;
it ceases about 8 or 10, and is succeeded by the land wind, which blows till 6 or 8 in the morning.
The sea breeze is stronger than the land wind, and, at the full and change of the moon, generally
blows with considerable force. As the sun rises in the heaven this wind gains strength, and declines
gradually as he approaches the western horizon; it is very refreshing, and is considered salubrious.
In the dry season the coast, from Cape Verd to Cape Lopez, or from 15° N. to 1° S. lat., is visited
by two remarkable winds, called tornadoes and harmattans. The harmattan or harmanta is an
easterly wind which prevails in December, January, and February; it commences at any hour of the
day, at any time of the tide, or any period of the moon; and continues sometimes only a day or two,
sometimes for five or six days, and has been known to last 15 or 16. There are generally three or
four returns of it every season; it blows with moderate force, not so strongly as the sea breeze, but
somewhat more so than the land wind. A fog or haze always accompanies it; and the gloom which
it occasions is so great as sometimes to render even near objects obscure. The sun appears only for
a few hours about noon, and is then of a mild red colour, exciting no painful sensation to the eye.
Extreme dryness is another remarkable property of the harmattan; no dew falls while it lasts, and
there the least appearance of moisture in the atmosphere; vegetation is much injured; tender plants
and most of those in the gardens are destroyed; the grass withers and becomes like hay; even the
vigorous evergreens feel its pernicious influence. The eyes, nostrils, lips, and palate of animals
animals become dry and disagreeable; the lips and nose become sore and even chapped, and, although
the atmosphere is cool, there is a troublesome sensation of prickly heat on the skin. If the harmattan
continue for four or five days the smart skin peels off, first from the hands and face, and afterwards
from the other parts of the body, if it continue a day or two longer. To a European it produces a
sensation of a very slight frost. Salubrity forms a third peculiarity of the harmattan: it is highly
conducive to animal health; people labouring under fluxes and intermitting fevers generally recover
during its continuance; and those who have been weakened by the disease or the remedies, recover
their vigour. It stops the progress of epidemics; and infection cannot be communicated even by art.
Its effect on furniture is very remarkable; it exposes the deceptions of the cabinet-maker in the
most singular manner; it contracts flooring so much that light passes through. The process of evapo-
ration, indeed, proceeds with astonishing rapidity. Tornadoes most commonly commence in May,
and cease when the rain sets in. They sometimes blow before or after the second rains, and sometimes
precede a harmattan; they are felt, however, with greater violence before the first rains. They blow
invariably from the eastward, that is from south-east to north-east; when they incline to the south-
ward of south-east they have more the appearance of steady gales of wind than of tornadoes. Tornadoes may be expected a day or two after the full and change of the moon, and give sufficient notice of
their approach, so that ships have time to prepare for them. When vivid and successive flashes of
lightning are seen in the east, attended by thunder and heavy clouds, while the horizon appears clear
and of a blueish cast, an approaching tornado is indicated. As the storm advances, the horizon be-
comes darkened, and soon the eastern sky is entirely overcast; the lightning flashes vividly and in
quick succession, attended by slow and apparently distant thunder. By and by a gentle breeze is felt,
which increases almost instantaneously to violent gusts of wind, which are usually accompanied with
rain, and which, in general, do not continue longer than half an hour or fifty minutes. When the
violence of the blast is over, the rain falls with great rapidity and in considerable quantity. The
lightning and thunder again commence, followed by wind and rain; but words cannot adequately
describe the awful sublimity of the scene. When the violence of the storm is over, rain continues to
fall for several hours; after which the sky clears up, but the sun continues obscured for the rest of
the day. During their continuance the thermometer falls 30 or more in a very short time. The
heavy rains which accompany and succeed a tornado, refresh the earth, quicken vegetation, and cool
the atmosphere to such a degree that the natives endure the mid-day heat of those months without
inconvenience; and, in July and August, when the people in the southern parts of Europe are exposed
to an oppressive heat, the natives and residents in Guinea enjoy a moderate and agreeable temperature, while vegetation proceeds with such rapidity, that the country, especially inland, exhibits a degree of fertility inconceivable to those who are strangers to tropical regions. *Meredith*, chap. I.

Of the mineralogy of Soudan very little is known; it produces abundantly in some places the precious article of gold. The kingdom of Bambouk is almost entirely a country of mountains, from which flow numerous streams, almost all of which roll over golden sands; but the principal depositories where the metal is traced as it were to its source, are the two mountains of Natakon and Semayia. The former of these consists of an almost entire mass of gold, united with earth, iron, and emery

In Semayla the gold is embedded in hard sandstone, and partly in red marble. Gold, indeed, seems to abound throughout all the range of the mountains of Kong; and a portion of Guinea has been named the Gold Coast, from the abundance of that metal which is or used to be brought from the interior. We know also that iron is forged in several places; and no doubt other metals will be found in abundance, when the pioneers of civilization shall have succeeded in reaching their localities.

The forests contain cocoa trees, palms, mangoes, bananas, tamarinds, papaws, citrons, oranges, pomegranates, and sycamores; the locust tree, which yields an agreeable beverage; the shea or butter tree; the tallow tree; the teak tree, now become a valuable article of export; and many others, among which the immense baobab or adansonia stands pre-eminent. Its fruit, called monkey's bread, affords abundant food to the negroes; the whole of Senegambia and Guinea is adorned with its green arcades; and the name of Cape Verde (the Green headland) is said to have been suggested by the hue of its foliage. Of aromatic plants are pimento, Spanish pepper, malagruette (cardamomum majus), and ginger. Cotton succeeds, and even excels that of Brazil; the indigo is excellent; and the valuable gums which the country supplies furnish important articles of commerce. These are gum-guaiac, red astringent gum, gum-copal, the inspissated juice of euphorbium, and gum-dragon; several dye-woods are also found. Alimentary plants are met with in great abundance, as maize, millet, rice, yams, casada, potatoes, pulse, plantains, bananas, guavas, chillees of all kinds, and other tropical fruits. A mucilaginous vegetable (*helluscus esculentus*) is plentiful in the country, and is much used by the natives in their soups. Another mucilaginous fruit called enteraba is also highly nutritious. European cabbage and eschallots are cultivated in some places; the sugar-cane grows spontaneously, and the black pepper has been discovered in the interior of the Gold Coast. The palm tree is very profitable to the natives; the trunk produces an agreeable, but intoxicating liquor, called palm wine; and the fruit yields an oil of great delicacy, which the natives use in all their dishes, and which has now become a very important article of their trade with Europeans. Of its leaf they make ropes and thread, which they convert into fishing lines and nets; a finer thread is made from the filaments of the leaf of the wild aloe and the pine apple. Tobacco grows every where abundantly, and the negroes are extravagantly fond of smoking it. The exuberant abundance of the aloes, balsams, tuberoses, lilies, and amaranths gives the flora of these countries a degree of magnificence which is quite surprising to Europeans. But perhaps the most singular feature of the vegetation is the height to which the Guinea grass grows. This plant forms immense thickets, from ten to thirty feet high, where herds of elephants and boars wander unseen. In the dry season it withers, and then, in order to clear the ground, the natives set it on fire. When kindled, the fire spreads with great rapidity, forming by night long lines of light, and by day filling the air with columns of smoke; and it is this practice which appears to furnish the most natural explanation of the "torrents of fire" seen by Hanno the Carthaginian in his voyage of discovery.

No part of the world produces greater numbers of elephants, monkeys, antelopes, deer, rats, and squirrels. In Soudan the elephant lives in a state of nature, and is no where tamed; the river-horse grows to a monstrous size; but the rhinoceros seems to be unknown. The lion is less common than the panther and the leopard; the spotted or striped hyena is frequently seen; jackals are formidable and destructive; the tall giraffe is found in the deserts; the zebra lives in droves, and is hunted for the sake of both its skin and its flesh. Varieties of monkeys abound in all the forests, the most remarkable being the kimpanzay (or chimpanzé, *Simia troglodytes*). It approximates less to the human form than the orang-outang of the Eastern Archipelago, but perhaps surpasses him in intelligence. Two remarkable animals, the *lemur galago*, and the *lemur minutus*, akin to the monkey tribe, have hitherto been found only in Senegambia. The poto or sloth is common in Guinea. The negroes catch the zibeth in a very young state, and tame it. The boar peoples the marshy forests; but the pig is small and weak. The dogs are of the size of setters, but approach in form somewhat to the mastiff; they do not bark, and their hair is short, coarse, and red, as in all warm countries. The horses of the Gold Coast are small and ugly, but Adanson admired the horse of Senegal; this river is probably the southern limit of the Berber or Moorish breed. The ass is exceedingly handsome and very strong. The negroes rear beeves, buffaloes, sheep, and goats. The birds exist in great numbers and in boundless variety; some of the smaller species are remarkable for the beauty of their plumage. The monoceros or trumpet bird is found in all the negro court-yards, along with the armed swan, the Egyptian swan, the pintado, and the greater part of the poultry known in Europe. Of the wild birds we may specify the aigrette, whose feathers form an article of trade; and beautiful parroquets in unlimited numbers, numerous families of sparrows and humming-birds sport round the huts of the negroes, and the baobab supports the nest of the solitary pelican.

The whole region is much infested with noxious and venomous insects and reptiles. Cameleons are very common on the Gold Coast; also crocodiles or alligators, lizards, land-crabs, guanas, scorpions, centipedes, and a variety of snakes, some of which are of enormous size. In the forests the termites or white ants display their astonishing industry, and their destructive power; but there are also numerous swarms of wild bees, whose honey and wax are objects of trade among the negroes. Crocodiles, cachalots, and manatis inhabit the mouths of the great rivers. Oysters are said to fasten in great multitudes on the immersed branches of the mangroves, with which these rivers are bordered; they are large, fat, and very agreeable food, though less cool and refreshing than those found in more northern latitudes. The lakes and rivers abound with mullet and other delicate fish; and the sea swarms with fish of various kinds, which are caught in great abundance during the dry season; turtle also are often found.

All the inhabitants of Soudan are of the Negro or Ethiopic family (see *antè*, p. 107), but among them are numerous varieties, some being more or less dark coloured, or making a near or more distant approach to the European character than others. Of these we must particularly distinguish the *Foulahs*, who are widely diffused over Africa. The great majority of the nation are found about the sources of the Gambia and the Rio-Grande; but colonies of them are also found on the banks of the Faleme and the Senegal: there are likewise tribes of them to the south of Fezzan, and on the confines of Bornou, and even in the interior of that kingdom, where they are called Fellatahs. They also inhabit the kingdoms of Massina and Timbuctoo on the Kawara, and have established a wide extended empire in Haoussa. They have a reddish black or a yellowish brown complexion, longer and less woolly hair than that of the negroes, less flat noses, and lips not quite so thick; with features which seem to indicate a mixture of Berber and Negro blood. They are a people of mild dispositions, with flexible dispositions and a natural aptitude for agriculture. They formerly did not live in towns, but were scattered over the country, attending to their herds and flocks, living in temporary huts, generally in the midst of unfrequented woods, and seldom visiting the towns. But from this condition they were roused by a countryman, Sheikh Othman Danfodio, a native of Ader, who built for himself a town to which the Fellatahs flocked. He led them to war and conquest, till at length doubly animated by the lust of plunder and the ardour of fanaticism, they have become a large and powerful nation; they are all Mahometans. With respect to the genuine negro races; the names of their families, tribes, and localities are sufficiently indicated in M. Balbi's table, contained in our general description of Africa. They are all in a low stage of civilization, living in the simplest manner, and practising only the simplest arts; but, at the same time, there is no part of the world where the influence of variety of government on the character of the people is more distinctly perceived than in Soudan. In general they have a great desire for gain, and will undergo many vicissitudes and

native states in Guinea are those of *Ashantee*, *Dahomey*, *Ardra*, *Badagry*, *Lagos*, &c. *Ashantee* has become, within the last century, a powerful empire, extending along the coast from the river St. Andrew, 6° W., to the Popo, a dependency of Dahomey, about 1° E. long., or altogether about 480 miles, comprising a number of petty states, tribes, and nations formerly independent. The Ashantees themselves amount to about 1,000,000 of people, inhabiting Ashantee Proper, a region of 14,000 square miles inland from the Gold Coast. They are a very superior class of negroes, manufacture excellent cotton cloth, smelt metals, and build large houses. The country is governed by a king, aided by four chiefs as counsellors. His majesty's legal allowance of wives is 4000; and polygamy is carried to a dreadful extent among his subjects. They are a brave, but savage people; they sacrifice whole hecatombs of human victims to propitiate the spirits of their ancestors; and, on the death of any member of the royal family, thousands are slain, to attend him in the other world. The capital of the empire is *Kommasi* or *Commassie*, 120 miles N.N.W. of Cape Coast Castle, a large town with regular streets, all of which are named, and each under the charge of an officer of police; but the houses are low, cemented with clay, and thatched. In the centre is the king's palace, inclosed with a wall, and containing small chambers decorated with a great profusion of gold and silver ornaments, and sculptures of birds and other animals pretty well executed. Commassie is the centre of a great trade, carried on not only with all parts of the empire, but also with Timbuctoo and Kashena in Central Soudan. Its permanent population is estimated at 15,000, but, on great festivals, 100,000 are sometimes assembled. The other principal places are: *St. Andrews*, near the middle of the Ivory Coast, the residence of a petty king, and the seat of considerable trade; *Cape Lahou*, a large trading town, which exports a great quantity of gold dust; *Grand Bassam*, a large town with a flourishing trade, particularly in the export of gold dust; *Accra* or *Ankran*, the capital of a kingdom of the same name, and containing about 12,000 inhabitants. In the interior are, *Abbradie* and *Dankara*, the capitals of two petty tributary states, which contain the richest gold mines in the empire; *Kickwicherry*, in the kingdom of Assin, and *Coranza*, in a kingdom of the same name, whose inhabitants are more civilized than the Ashantees; *Diabbie*, the capital of Amina; *Sallagha (Sarem)*, the capital of the kingdom of *Inta*, which extends to the left of the Rio Volta, and whose inhabitants are chiefly Mahometans, distinguished for their industry and civilization. Sallagha is one of the greatest commercial marts in the empire. *Yandi*, the capital of the great kingdom of *Dagoumba*, is a very commercial town about as large as Kommassie, and the residence of a Mahometan king, who is tributary to Ashantee. The inhabitants are very industrious, and the town contains an oracle of great repute among the negroes.

The kingdom of *Dahomey* appears to extend from the eastern frontier of the Ashantee empire to the frontiers of Yarriba. It contains a number of large and populous villages; the principal towns are: *Abomey*, the capital, about 80 miles from the coast, a well-built town, with 24,000 inhabitants; but the king usually lives at *Calmina* or *Agona*, where he has two palaces or country houses; *Whydah*, the capital of a kingdom of the same name, formerly independent; *Gregoy*, a large town with 20,000 inhabitants; *Grand-Popo* or *Ifa*, a considerable town on an island at the mouth of the Moussi, and the capital of a small tributary state. The kings of Dahomey have been long famous for their ferocity. Mr. Dalyell, who paid one of them a visit towards the end of last century, found the road to the royal cottage strewed with human skulls, and the walls adorned, or almost covered, with jaw bones. His government is the most rigorous despotism, the lives and properties of his subjects being entirely at his disposal.

The kingdom of *Ardrah*, formerly tributary to Dahomey, but now belonging to Yarriba, is situate on the coast to the south-east of Dahomey. Its capital, *Allada* or *Ardrah*, is a well-built and commercial town, with 20,000 inhabitants. The kingdom of *Badagry* is a very small state, whose capital, of the same name, is the place where several European travellers have landed on their way to the interior. The kingdom of *Lagos* or *Awane*, is a small state at the mouth of the river Lagos. Its capital, of the same name, has about 5000 inhabitants, and has become noted as the largest slave market in Guinea. It is built on a small island at the entrance of *Cradoo Lake*, which extends about 70 miles parallel to the sea, from which it is separated by a narrow bank, and communicates with the river of Benin.

Along the coasts of both Senegambia and Guinea, several of the European nations have long had settlements. Those of the French are situate on the Senegal, and along the coast between the desert and the Gambia; the Portuguese stations are between the Gambia and Sierra Leone; the British and Dutch settlements are on the Gold Coast, and the former also at Sierra Leone and Isle de Los in Senegambia.

The *French Possessions* are divided into the two arrondissements of *St. Louis* and *Goree*; the former comprising the island of *St. Louis* in the Senegal, and those of *Babague*, *Safal*, and *Ghimbar*; and the different factories along the river, as *Kamou*, *Makana* or *St. Charles*, *Bakel*, *Dagana*, and *Faf*; with the *escales* or gum markets of *Coq*, *Darmankours*, and *Trarzas*; and also that part of the sea coast, which extends from Cape Blanco to the Bay of *Iof* or *Yof*, on the north side of Cape Verde. The arrondissement of Goree comprises the island of *Goree*, and the coast from the bay of Iof to the mouth of the Gambia, where is situate the factory of *Albreda*. But it may be remarked that the French dominion does not extend over all the countries which border these coasts, most of which are independent. The capital of the French possessions is *St. Louis*, a well-built town, on an island or sandbank in the Senegal, near its mouth. It is the entrepot of the trade of that river, the principal article of which is gum. It has an agricultural society, and contains about 6000 inhabitants. *Goree*, a small town, with about 3000 inhabitants, is situate on a small island or rock, of the same name, on the south side of Cape Verde. *Bakel*, on the Senegal, in Bondou, is a small place with only 400 inhabitants, but has a garrison of 100 soldiers. *Dagana*, a negro village in the kingdom of Walo, with 1200 inhabitants. *Makana* or *St. Charles*, a factory built in 1825, on the site of Fort St. Joseph, above Bakel. *Portendik*, on the coast, in the territory of the Moorish tribe of Aulad-Ahmed-Dahman, is inhabited only at the season for selling gum to European traders. It is about 170 miles N. from the mouth of the Senegal, and there are large gum forests in the neighbourhood.

The *Portuguese Settlements* comprise only the small places or stations of *Cachao*, *Bissao*, *Zinghichor*, *Farim*, and *Geba*, all in the vicinity of the Rio Grande and Casamanza rivers, and *San Domingo* on the Rio Pongo. *Cachao*, a small town with a harbour, and 500 inhabitants, is the residence of the governor.

The *British Possessions* in Senegambia are those of *Sierra Leone*, the *Isle de Los*, and *the Gambia*. *Sierra Leone* (Lion Hill) is a peninsula, extending from the estuary of Sierra Leone to Yawry bay; presenting an irregular mass of peaked mountains, with valleys and prairies lying between them. The mountains are covered to their summits with lofty forests, which give the scenery a beautiful, rich, and romantic appearance. The river which forms its eastern boundary is a noble estuary extending 20 miles inland, varying in width from 10 miles at its entrance, to 4 where it terminates. The settlement was formed in 1787, with the view of commencing the introduction into this part of Africa of the benefits of European civilization. It has been largely colonized by maroons and negroes from America and the West Indies, and captured slaves; and in 1833, contained 29,764 inhabitants; but its prosperity has advanced very slowly, and, so far as regards the objects originally intended, the settlement may be pronounced a failure. Throughout the peninsula there are several villages; but the capital is *Freetown*, at the northern extremity, a well-built place, with regular and spacious streets. The settlement has long laboured under the imputation of extreme unhealthiness, and has been called "the white man's grave," but it has of late years very much improved in this respect, and

is, indeed, now represented as not more unhealthy than any other place within the tropics, Europeans being indebted for their great mortality more to their improper manner of living than to the character of the climate. The *Isles de Los*, in N. lat. 9° 16', W. long. 16°, five in number, about 60 miles N. of Sierra Leone, are very valuable as a station for the trade which is carried on with the rivers of the adjacent continent, consisting in the exchange of British goods, for hides, ivory, gold dust, &c. There are several establishments on the Gambia. The principal is *St. Mary's Island*, at the entrance of the river, which it commands; it is 15 miles long, but narrow and flat; its chief town is *Bathurst*, at the eastern point. *Fort-James* is situate on an island about 30 miles up the river, only 200 yards long and 50 broad, and imperfectly fortified. Opposite the fort, on the north bank, is *Jillifree*, in a healthy situation, and surrounded by a fertile district. On the south bank are *Vintain*, *Tancrowal*, and *Jonka-konda*, of which the first is 2 leagues, the second 12, from fort St. James, and the last is considerably up the river. *Macarthy's Island* is more than 300 miles up the river.

The *British Settlements on the Gold Coast* are *Dix-Cove*, *Succandee*, *Commenda*, *Cape-Coast Castle*, *Annamaboo*, *Tantum*, *Winnebah*, and *Accra*. These were formerly in the possession of the African company, and afterwards taken under the immediate charge of the British Government, but in 1828 were again placed under the management of the merchants of London engaged in the African trade. The business in London is managed by a committee of three merchants, appointed by Government, and accountable to the Secretary of State for the proper application of the funds allowed for the maintenance and defence of the settlements, which amount to £3500 a-year. With this sum eighty men are clothed, armed, and maintained, for their defence, and all other expenses provided for. The forts are governed by a president and council. *Cape-Coast-Castle* stands on a rock of gneiss and mica slate, about 20 feet above the level of the sea, in 5° 6' N. lat., and 1° 10' W. long.; it is an irregular square, with a bastion at each angle (Mr. Martin says "*four* bastions at each angle," which is certainly incorrect), the whole mounting about 80 guns. Within are spacious buildings for the accommodation of the residents. Outside there is a native town; and the adjacent country to a considerable distance has been cleared and rendered fit for cultivation. The ruling natives are the *Fantees*, a clever, stirring, turbulent race. *Annamaboo*, 10 miles E. of Cape-Coast Castle, is a good square fort close on the sea, with a native town embracing it in the form of a crescent. At *Accra*, in 0° 5' W. long., is the British station of *James' Fort*. The other settlements, says Mr. Martin, require no separate notice. The trade of these settlements, and generally of Western Africa, is of considerable importance to Great Britain, and is yearly increasing. The exports alone amount to the value of £300,000.

The Dutch settlements consist of: *Fort Antonina*, near *Axim*, and *Fort Hollandia* or *Fredericksburg* near *Pockoe*, with several others. The principal settlement is *Elmina*, or *St. George de la mine*, which is the residence of the governor-general. It is a well-built town, with a good citadel, and a fort, a great trade, and about 10,000 inhabitants.

The principal Danish settlement is *Christiansborg*, 2¼ miles from James Fort at Accra. The Danes have several other small forts and factories along the coast.

In 1821 a colony of free blacks from North America was founded on the Grain Coast of Guinea, with the view of providing a place to which that class of the inhabitants of the United States might be induced to remove, as well for their own benefit as for that of their native country, over which they might gradually spread some part of the civilization which they had themselves acquired in the new world. The managers of the colony have purchased or otherwise acquired a tract of country extending about 225 miles along the coast, with a breadth inland of 20 or 30, to which they have given the name of *Liberia*. The number of colonists amounts to about 4000. The soil is said to be fertile, and the climate better than in most other parts of the coast. Rice, cotton, coffee, sugar, indigo, bananas, cassava, and yams, are raised; and camwood, palm-oil, ivory, hides, wax, and pepper, are among the exports. The settlement is visited by traders from the interior; and some trade is carried on with Europe and America. The local interests and minor affairs are confided to the colonists themselves, who elect two legislative chambers; but the government is substantially vested in the agent of the American Colonization Society. Their chief town is *Monrovia*, on Cape Mesurado, N. lat 6° 25'; W. long. 10° 46', and contains 1200 inhabitants.

CENTRAL SOUDAN contains the following states and towns: — *Sangaran* or *Sangara*, a large country inhabited by idolaters, under several independent chiefs, and containing the sources of the Joliba. *Youre*, a small country inhabited by Jalonkes, and governed by a Moslem chief, is a hilly region with rich gold mines, the produce of which supplies the markets of both the coast and the interior with that precious commodity. Its capital is *Boure* on the Tankisso, an affluent of the Joliba on the left. *Kankan*, to the north of Sangaran, on the Milo, is a busy commercial town with 6000 inhabitants, all Mahometans, and is the capital of a state of the same name. *Wassoulo*, to the north of Kankan, is inhabited by idolatrous Foulahs, who are nevertheless very industrious as shepherds and cultivators. The small village of Sigala is the seat of the chief, who is rich in his possession of gold and slaves. *Bambarra* lately formed an extensive and powerful kingdom, but is now divided into two states, which may be called Upper and Lower Bambarra. In the former is *Sego*, on the Joliba, a large town with 30,000 inhabitants, according to Park, and the capital of the kingdom; *Bammakoo*, a commercial town farther up the river; *Maraboa*, *Yamina*, *Sami*, *Sansanding*, and *Sego*. The kingdom of Lower Bambarra was established some years ago by a Foulah chief, and is now the principal power in Western Soudan. Its capital is *Jenneh*, a large well-built town at the end of a small island in the Joliba, and is the seat of a great trade. *El-khamdo-Illah*, 80 miles N.E. by N. of Jenneh, was recently founded for the purpose of enabling the pupils at the schools to pursue their studies away from the distractions and the noise of the capital. *Isaca*, at the confluence of two branches of the Joliba, is the port of embarkation for travellers to Timbuctoo. *Yassina*, on the Joliba, is the capital of a kingdom governed by a brother of the chief of Jenneh. The kingdom of *Kong*, noted for the industry of its inhabitants, lies to the south of Bambarra, among the mountains to which it gives its name. Its capital is a place of the same name. Further down the river, on the right bank, is the state of *Bandu*, inhabited by a commercial people resembling the Mandingoes. The *country of the Dormans* extends along the right bank of the Joliba from the lake Debo to the environs of Dire, a village dependent on the king of Timbuctoo. Its chief resides at *Aboulia*. The kingdom of *Tombuctoo* (Timbuctoo), which extends along the Joliba, is now confined to much narrower limits than it once possessed, and is obliged to pay tribute to the Tuariks to prevent them from plundering the caravans which come from all quarters to the central point formed by the city of *Timbuctoo*. It is a large open town, 3 miles in circuit, situate in a sandy plain, 5 miles N. of the Joliba; the houses are mostly built of brick, but have only a ground-storey, and the streets are wide enough for three horsemen to pass abreast. It contains seven mosques. Though its trade has much declined from what it was, yet Timbuctoo may be considered as the principal mart of this part of Africa. Its port is at *Kabra*, a small town on the left bank of the Joliba. *Borgou*, chiefly to the right of the Kawara, is a confederation of several petty kings, the most powerful of whom are those of *Bawa*, *Kiama*, *Nifé*, and *Boussa* or *Bussh*. The capital is *Boussa* or *bussh*, on the left bank of the Kawara, with about 12,000 inhabitants. *Kiama*, on the flank of a chain of hills, the residence of the sultan of Yarro, appears to be the most commercial and populous town of Borgou, and contains so many as 30,000 inhabitants. *Wawa*, one of the finest towns in the country, contains 18,000 inhabitants. The kingdom of *Yaouri*, situate between Haoussa and Borgou, is the most powerful in this part of Soudan, and its sultan has suc-

cessfully repelled the aggressions of the Fellatahs. *Yaouri*, the capital, is a large, fortified, populous, and commercial town on the left bank of the Kawara, in the north-eastern angle of intersection of 11° N. lat., and 5° E. long. The kingdom of *Nyffe* or *Tappa*, to the left of the Kawara, is divided between two brothers, one of them a Mahometan supported by the Fellatahs, the other a pagan. The capital of the former is *Tabra*, a town with 20,000 inhabitants, on the Mayarrow, an affluent of the Kawara. *Koulfou*, a little to the east of Tabra, is the most industrious and busy town in Nyffe, with 12,000 or 15,000 inhabitants. *Rubba*, a large, populous, and commercial town of Nyffe, near the left bank of the Kawara, seems to be in possession of the Fellatahs. It is a great entrepot of the trade of Soudan. *Egga*, to the right of the Kawara, a large and populous city, distinguished for the commercial activity of its inhabitants, who possess a large number of vessels with which they trade up and down the river. The *kingdom of Yarriba*, which extends from Pouka near Badagry, on the slave coast, to the frontiers of Borgou and the right bank of the Kawara, in 10° N. lat., is one of the principal states in this part of Africa; the kings of Dahomey, Alladah, Badagry, and Maha, are its tributaries, and Benin is an ally. The capital is *Eyeo* or *Katunga*, a large town 15 miles in circumference, built on the slope and round the base of a small chain of hills. It is surrounded by a wall 20 feet high, and a ditch; the houses are built of clay and thatched. The other principal places are: *Bohou*, a large town, formerly the capital; *Daffou*, with 15,000 inhabitants; *Jannah*, *Chaki*, *Kouso*, with 20,000 inhabitants. The kingdom of *Fundah*, *Fandah*, or *Founda*, which is very imperfectly known, extends along the Tchadda, and exercises dominion over a great part of the country situate to the left of that river. Its capital is *Fundah*, on the river Okwah, a small affluent of the Tchadda; which is said by Mr. Laird to be as large as Liverpool, and to contain about 60,000 or 70,000 inhabitants, who manufacture cotton stuffs, leather, good beer, and iron. *Jamnahar* or *Ymahah* on the Tchadda, is the port of Fundah in the dry season. The *kingdom of Benin* or *Adou*, one of the most powerful in Soudan, extends along the coast from Lagos to Bonny, and 20 days' journey inland; thus including a large portion of the delta of the Kawara; but the interior is still very little known. The capital is *Benin*, a town with about 15,000 inhabitants, 70 miles from the coast. *Wari* a small town with a population of 5000, the capital of a small dependent kingdom of the same name, is inhabited by the Jackeris, a negro race remarkable for their industry, and the mildness of their manners, which form a singular contrast with the ferocious habits of their neighbours, the people of Benin. *Bonny*, a town with 20,000 inhabitants, on an island at the mouth of a branch of the Kawara, is the capital of an oligarchic republic tributary to Benin. It was recently the greatest slave market in Guinea, and is still one of the most extensively commercial towns. *Brass*, a trading town on a creek of the river Nun, west of the Bonny river; with 2000 inhabitants. The *kingdom of Qua* extends from the St. Anthony or Andony river to the Rio del Rey. Its capital is *Old Calebar* or *Bongo*, and its inhabitants, though idolaters, are somewhat civilized. The Old Calebar river forms a wide estuary, navigable for large vessels up to *Ephraim* town, which is governed by a chief who assumes the title of Duke; it contains about 6000 inhabitants. On the lower part of the Kawara are several places, which our information does not yet enable us to assign to any of the great political divisions. *Boqua*, *Bockwey*, or *Iccory*, on the left bank of the river, immediately below the hills, is a sort of free port or neutral place, where the people of hostile states may meet without danger. *Atta* or *Itta*, *Addah* or *Iddah*, 7° 40′ N., also on the left bank, is a large town with 15,000 inhabitants. *Damuggo*, on the left bank, 40 miles below Attah, is the seat of a chief who possesses a flotilla. *Kirri* or *Kurree*, a large town on the right bank, 25 miles below Damuggo, is one of the principal markets in Soudan. *Ibou*, *Eboo*, *Ebboe*, a small town of 6000 inhabitants, not far from the right bank of the Kawara, is the capital of the kingdom of Ibou, and one of the principal marts of the lower part of the river.

The principal states included in the BASIN OF THE TCHAD are the following: — *Bornou* is situate along the sides of the great lake, and seems to consist of *Bornou Proper*, to the south-west of the lake; *Kanem* to the north and east; *Loggun* to the south; a part of *Mandara*, to the south of Loggun; and a part of the country of the *Mungas* or *Mungowi* to the north of the Yeou. The capital is *Birnie* or *New Bornou*, a walled town with 15,000 inhabitants, not far from the Tchad. The other principal places are: — *Kouka*, a small and recently built town, the residence of the Sheikh El Kanemy, who was the actual ruler of Bornou in 1826; *Angornou*, the largest and most commercial town in the empire, with 30,000 inhabitants, besides strangers; *Digoa*, a large walled town, with a population of 30,000; *Birnie* or *Old Bornou*, on the Yeou, formerly the capital, is now entirely ruined; but an extensive space covered with the remains of buildings still attests its ancient importance, when it contained 200,000 inhabitants. *Gambarou*, once a large town on the right bank of the Yeou, is also in ruins; *Delow*, sometime the capital of Mandara, with 10,000 inhabitants; *Mora*, the present capital of Mandara; *Maou*, the capital of Kanem. The *kingdom of Baghermeh*, situate to the south-east of the lake, borders on Bornou, but its extent is unknown. The inhabitants are noted among the Africans for their bravery and their industry. *Mesna* appears to be its capital. The *kingdom of Mobba* called *Dar Szaleh* by the Arabs, *Wadai*, by the people of Fezzan, and *Borgou* by the Bornouese, is too imperfectly known to be described. Its capital is *Warra*, which is said to be three times larger than Boulak near Cairo. Only a part, however, of the kingdom seems to belong to the basin of the Tchad. The same may be said of *Dar-Fur*, a considerable territory situate between Dar-Szaleh and Kordofan, and of which the capital is *Kobbe* or *Cobbe*, which was visited by Mr. Browne in 1793. It is a dry desert country, lying between the basins of the Tchad and the Bahr-el-Abiad.

The EMPIRE OF THE FOULAHS or FELLATAH belongs partly to the basin of the Kawara, and partly to that of the Tchad, but the larger portion may be assigned to the former. It was founded by the Sheikh Othman Danfodio, who was a proficient in all the learning of the Arabs, and enjoyed the reputation of being a prophet. He came originally from the woods of Ader or Tadela, and, having settled in Ghoober, built a town, where the Fellatahs soon began to collect round him. Driven from it by the Sultan, he again settled in Ader, where he built another town; from all quarters Fellatahs flocked to his standard; and in the course of a short time he acquired possession of the whole of Haoussa, with Kano Kubbe, Youri, and part of Nyffe, and extended his ravages almost to the sea-coast. He died in 1816, when his son Bello succeeded to the government of Haoussa; while the conquered territories to the westward were given to his nephew. *Saccatoo*, the capital, is a large city on the top of a low hill near an affluent of the Kawara, about four days' journey from the great river. It was built in 1805 by Danfodio, and has been surrounded by Bello, with a wall 24 feet high, and a dry ditch. Its population is estimated at 80,000. The other principal towns are: *Kashenah*, *Cassina*, *Kashna*, formerly a large city, but now so reduced as to occupy only about a tenth part of the enclosure within its wall; *Kalawawa*, the chief town of Ghoober; *Zirmi*, the capital of Zamfra; *Zariya*, the chief town of Zegzeg, a new town built by the Fellatahs, and containing 50,000 inhabitants; *Magaria*, in Ader, a fine town built by Sultan Bello, which is becoming daily more considerable; *Kano*, the principal mart of Central Africa, a large town with 40,000 inhabitants, is about 15 miles in circumference, and is surrounded by a wall 30 feet high and two dry ditches; but the interior is divided into two by a bahr or morass, which forms a lake in the wet season; *Baebaegie*, in the province of Kano, is a large town with several stone houses, and from 20,000 to 25,000 inhabitants, all devoted to commerce. *Kotonko*; *Zangaeia*; *Katagoum*, on an affluent of the Yeou, one of the principal fortresses of the empire, with 7000 or 8000 inhabitants.

SOUTHERN AFRICA.

THE whole of the continent south of the equator is properly entitled to this appellation; but the limits of the division may be extended a little further north, so as to include the unknown regions which have the great central chain, or supposed chain, of mountains for their northern border, or in other words, to a line drawn from the Cameroons on the Bight of Biafra to the Gulf of Aden. The region may be divided into four portions, the first three of which we shall describe separately, namely, 1. *The Maritime Regions on the West Coast*; 2. *The Maritime Regions of the East Coast*; 3. *South Africa*; and 4. *The Unexplored Interior*, respecting which nothing is known.

§ 1. *Countries on the West Coast.*

These countries, in former times, were usually denominated *Lower Guinea*. The portion extending from the Cameroons to Cape Lopez, is called the *coast of Gabon*; but almost nothing is known of the interior. The evidence, however, which we already possess on this subject goes to prove that along the coast, through 1000 miles in latitude, and probably 40 miles to seaward, there is a constant evolution of sulphuretted hydrogen gas, the breathing of which is extremely injurious to health: and, says Professor Daniel, it is not improbable that our cruisers on the coast are exposed to its exhalations given out from the ocean under a tropical sun, over an area of 40,000 square miles in extent. This he ascribes to the circumstance of the numerous rivers which flow into the Bight of Biafra, from a richly wooded country, bringing down much vegetable detritus, and forming deposits of mud at their mouths; and that thus the most favourable conditions for generating sulphuretted hydrogen are present, in this very case in which so large a quantity of the deleterious gas is found.—*Trans. of Africa, Feb.* 1841.) The only place of any importance on the coast is *Naango* or *Georgetown*, the principal slave market. It is situate on the river Gabon, which flows into Corisco bay, to the north of the equator.

Loango appears to extend from Cape Lopez to the Zaire, or some miles farther, and includes a number of different states or petty kingdoms which we need not particularise. The coast is high and abrupt, but the hills are covered with soil and luxuriant vegetation. The soil is generally a red loam, and very productive; but near the coast is an extremely fine sand. The lakes and rivers abound with fish, and the forests with wild beasts. The climate is excessively hot. Rain sometimes falls; but the dews are sufficient for vegetation. Almost the only grains cultivated are manioc, maize, and a species of pulse called msangen; but the greater part of the country is covered with tall grass. The finest fruits grow wild; sugar-cane attains an extraordinary size; palm-trees are very plentiful. Potatoes and yams are also very abundant. The Chinese hog is the only animal reared for domestic use. The people reside in villages, or clusters of straw huts in the midst of palm groves. They are in the lowest state of degradation, indolent, debauched, filthy, cowardly, and superstitious. The capital of all the country is *Loango* or *Bawru-Loango*, situate in a large and fertile plain, about two miles from the coast, in 4° 36′ S. lat., and is said by M. Grandpre to have a population of 15,000. The other principal towns are: *Kingulle*, the capital of Ca-Congo; *Malemba*, a great slave market on the coast; *Cabenda*, in Ngojo, in a beautiful situation, with a fertile soil, and a good harbour, is one of the principal slave markets on the coast.

CONGO, as originally known to the Portuguese, extended from Cape Lopez to Cape Negro, including not only Congo Proper, but also Loango, Angola, and Benguela; but its limits seem to be now restricted to a small territory, stretching along the left bank of the Zaire. Near the sea the country is low and flat, traversed by numerous streams, and abounding in sandy deserts, but in general very fertile. The climate is very pestilential. The interior consists of a number of terraces or acclivities forming a fine, rich, and populous region. The principal physical feature is the great river *Zaire*, called also *Congo*, *Barbela*, *Moinzi-Enzaddi*, and *Zambere*, which enters the Atlantic Ocean with a great body of water in 6° 5′ S. lat. Immediately off its mouth, in the current of its channel, Captain Tuckey found no bottom with 150 fathoms of line; and it was observed, that though the current made a rippling noise, resembling that of a mill sluice, yet it was seldom found to exceed 4½ or 5 knots an hour, and in many places not more than 2½. At its mouth it is 10 miles wide; a little higher up it diminishes to 7; and at 140 miles from the sea, narrows commence, and continue for 40 miles, through which space the river is generally not more than from 300 to 500 yards wide, and generally confined between rocks. Above the narrows, for about 100 miles, the river again expands to the width of two, three, and even more than four miles, flowing with a current of two or three miles an hour. Higher up, the natives stated to Captain Tuckey, that they knew of no impediment to the continued navigation of the river, and that the only obstruction in its north-east branch was a single ledge of rocks, forming a sort of rapid, over which, however, canoes were able to pass.—(*Narrative of an Expedition to Explore the Zaire, &c.* in 1816. Of its origin and affluents nothing positive is known. It overflows in the rainy season to the height of 12 feet; and has also risings in the dry season to the height of 7 feet. The banks are clothed with a most luxuriant vegetation. The country is divided into a number of petty states, each governed by a chevou or chief, acknowledging the supremacy of Blindy N'Congo, who resides at Banza-Congo. The Congoese belong to the least favourable race of negroes, and are sunk in the lowest state of degradation and superstition. Their religion is fetichism, with a mixture of Christianity introduced by the Portuguese, and idolatry; but the people are said to be sincere, hospitable, and compassionate.

ANGOLA, DONGO, or AMBONDE extends to the south of Congo, being about 350 miles from E. to W., and 50 or 60 from N. to S. It is properly a part of Congo, from which, however, it has been politically separated since the middle of the 16th century. It is extremely mountainous, being destitute of plains, except on the sea shore, with some small flats on the sides or in the gorges of the mountains. It is extremely well watered; the principal streams are the *Coanza*, *Benga*, and *Pamda*, the first and last of which form the southern and northern boundaries of the country. The soil on the coast is sandy but not desert; in the interior, it is rich and productive. The climate is excellent, and the heat temperate. Gold and silver have been discovered in the mountains near the coast; but no gold dust has been found. Iron is plentiful, and copper is also said to exist; lead, sulphur, and petroleum are its principal mineral productions. Every species of tropical vegetation is abundantly produced; and all the animals common to intertropical Africa are found. The people are black, but have few of the negro peculiarities in form or feature; blue eyes and red hair are not uncommon among them. The population is said to be dense. The capital, *St. Paul* or *Loanda*, is said to contain 8000 inhabitants.

The Portuguese established a factory on the coast in 1485, and their power has been constantly extending ever since; they have one establishment 700 miles inland, and exercise great influence over

the numerous petty chieftains among whom the country is parcelled out. The chieftains, however, are all subject to a sort of king, called the Incue. The principal articles of export are ivory and slaves, the latter of which are carried off in great numbers to Brazil.

BENGUELA extends along the coast from the Cowara river to Cape Negro, or from 9° to 16° S. lat., a distance of about 460 miles. It appears to be mountainous, and watered by a great number of streams; and the elevation of some parts of the country is so considerable as to occasion a great degree of cold. Dense forests of cedars, palms, boobash, date-trees, tamarinds, and other tropical trees, with some which belong to the temperate zone, clothe the sides and the tops of the mountains, mixed with vines, bananas, and other species of fruit-trees of the finest quality; but, owing to the indolence of the people, grain is not very abundant. Wild animals are extremely numerous; and also cattle, sheep, and goats. The mountains yield copper, sulphur, petroleum, and crystals. The coast is excessively unhealthy; but the interior is salubrious. The rainy season lasts generally throughout May and June; but it is very irregular, and sometimes no rain falls for three years in succession. The country is chiefly inhabited by petty tribes of independent and very savage barbarians; the most noted of whom are the *Gagas*, *Gigas*, or *Jagas*, a wandering set of robbers, who acknowledge no tribe or nation. They destroy all their own children, and keep up their numbers by stealing others. They are bold and skilful soldiers, but ruthless cannibals, without the slightest idea of art or industry, carrying destruction and desolation to every place they visit. The Portuguese have long had settlements on the coast and in the interior; but their power does not seem to extend far beyond their forts. Their principal settlement is *San Felipe de Benguela*, a small town with a fort in an unhealthy situation, on a bay of the north coast, 12° 40′ S. lat. The rest of the coast to the south of Benguela is a sandy desert without water, scantily peopled, or traversed by the Cimbebas and Damaras.

§ 2. *The East Coast.*

From Bab-el-Mandeb to Cape Guardafui, the coast extends eastward for about 600 miles, forming the southern border of the Gulf of Aden. This, as well as the country of Ajan, to the south of Cape Guardafui, as far as the river Juba, a little to the south of the equator, has no other distinctive name than *Barra Somauli*, or the land of the Somaulis, a people who live in numerous independent tribes. They are a mild race, of pastoral habits, and confined entirely to the coast, the whole of the interior being occupied by the savage Gallas, and appear to be the descendants of the aborigines of the country, who were early converted to Islam by the Arabs, who traded with them. The north coast, sometimes designated on maps *Adel*, has three towns, which are little visited by Europeans. *Zeila*, a small town of 500 inhabitants, inclosed by ruinous walls, and possessing a shallow harbour; and *Tajurrah*, a mere village, of 70 or 80 wooden huts, but with a capacious harbour, and good anchorage, were recently (1839) subject to the Pasha of Egypt. *Berbera*, *Barbara*, or *Burbureen*, remained unknown in Europe till 1826; it is situate on the coast, 220 miles S.E. of Bab-el-Mandeb, and may be described as a large encampment, rather than a town, the permanent residents, during the hot season, not exceeding 100 families; but from September to April, there is an annual fair or mart, at which sometimes so many as 10,000 people are assembled, who live in tents formed of sticks covered with skins. Their great object is to barter the produce of the inland country for goods brought from Arabia. The chief articles exported are ghee, coffee, sheep, gum, myrrh, ostrich feathers, gold dust, hides, skins, and slaves. Coffee is brought from a distance of 40 days' journey in the interior, and as it forms the principal part of the return cargoes of the vessels, the quantity exported must be very great. The whole trade is in the hands of Baniars. Cape Guardafui, named *Ras Aseré* by the Arabs, is a bold headland, immediately to the south of which is the *Jebil Jordafún*, a high mountain, from which the European name of the Cape itself seems to be derived.

From Guardafui the coast extends in a south-westerly direction, but with various windings, to the Cape of Good Hope, under the various names of *Ajan* or *Ajen* (Arab *Haxiné*, *i.e.* the rough ground), *Zanguebar*, subdivided into *Magadoxa*, *Melinda*, *Zanzibar*, and *Quiloa*; *Mozambico* or *Moxambique*; *Sabia*, *Inhambané*, and *Caffraria*. This long sweep of 3000 miles is chiefly occupied by negro tribes in a state of great barbarism; though some of them are numerous, and not quite destitute of arts and industry. Arab colonies are also to be found at various places along the coast. The sovereignty, as far as the river Mozimba, to the south of Cape Delgado, is claimed by the Sultan of Muscat; the remainder, as far at least as Delagoa bay, by the Portuguese; but the only territory which the latter really possess is the Captaincy of the *Rios de Senna*, which contains about 3600 square leagues. The town of the same name is situate on the Zambeze river, in 17° 30′ S. lat., 35° 15′ E. long. This Portuguese territory is traversed by the great river *Zambeze*, which enters the Indian Ocean in lat. 18° S., by five principal channels, named the *Luaboel*, *Luabo*, *Couama*, and *Quilimané*. Its sources are unknown, but the river is said to be navigable for canoes for 300 leagues. The lower part, however, of its course has been found to be scarcely navigable by larger vessels, even boats, owing to the great rapidity of the current, and the numerous sandbanks with which its bed is choked and divided. It has many considerable affluents; and so great is the rush of the floods from its various mouths, that, four miles from the land, the water is perfectly fresh.—(*Journal R. Geog. Soc. Lond.* II. 136; III. 204.) Proceeding along the coast southward from Cape Guardafui, the first place worthy of notice is the peninsula of *Hafoon*, which projects a considerable distance seaward, appearing like an inland. *Magadoxa*, or *Mukdeshu*, or *Mukdesha*, 2° 1′ 8″ S. lat., 45° 19′ 5″ E. long., is a considerable town with an imposing appearance, the buildings being considerably large, and of stone, overtopped by four minarets. But these are only tenanted by the dead, the living population being resident in low thatched huts. *Brava*, within the territory of Magadoxa, is also a port of some importance. *Melinda* or *Maleenda*, once a flourishing city, has been totally destroyed by the savage Gallas. *Mombaz*, 4° 4′ S. lat., a town in possession of Arabs, is only a mass of huts, hovels, and ruins. It is situate on a small island on a bay or gulf, which forms, perhaps, one of the most perfect harbours in the world. The island is surrounded by cliffs of madrepore, capable of being rendered, by very little labour, almost impregnable. Farther south are the two large islands of Pemba and Zanzibar. *Pemba* is 30 miles in length by 10 in breadth, and 18 from the mainland; it is low, and rests on a coral foundation, but is covered by a most productive soil, yielding every kind of produce, especially rice, and being in fact the granary of the neighbouring country. *Zanzibar*, 25 miles S. of Pemba, is about twice the size, but resembles it in almost every other respect, producing abundantly grain and sugar; but the climate is unhealthy. They both belong to the Sultan of Muscat. The foreign commerce of Zanzibar is considerable, and almost entirely in the hands of the Americans and English; the Sultan farms out the customs for about £30,000 a-year. *Quiloa* (Kealwa) once a large and flourishing city, has now dwindled to a mere village, governed by the Muscatese officers. *Cape Delgado* is situate in 10° 40′ 2″ S. lat.; and immediately to the southward is the extensive line of the *Querimba Islands*, which are all composed of coral, low, of various sizes, and abounding with excellent harbours, which afford perfect security in the heaviest gales.

Within the Portuguese territory, besides Senna, already mentioned, the principal places are:—*Mozumbique*, *Quilimané*, *Sofala*, *Inhambane*, and *Bahia de Lourenzo Marques* or *Bahia da Alagoa*. The harbour of *Moxambique* is formed by a deep inlet of the sea 5½ miles broad and 6 long. At the entrance are three small islands, which, together with reefs and shoals, render the anchorage perfectly safe in the worst weather. The islands are formed of coral, and named *Moxambique*, *St.*

§ 3. *South Africa.**

The name "South Africa" though properly applicable to the whole of that portion of the continent which lies south of the Equator, is usually restricted by its European possessors to the country at the extremity of the African continent, between the Cape of Good Hope and the countries possessed by the various aboriginal tribes with which the colonists have intercourse. In this sense the term must be five hundred miles from the Atlantic to the Indian Ocean; while the country extends southwards through nearly [illegible] degrees of latitude, to Cape L'Aguilhas, or to the extremity of the continent, the northern limit may be formed by a diagonal line drawn from Walvisch Bay, on the west coast, to Delagoa Bay on the east coast. Of this region, the *Cape Colony* occupies the southern extremity, to the extent of about 650 miles in length from east to west, with a mean breadth of 230 miles, rising an area of 150,000 square miles, and having a sea-coast line of about 1200 miles.

GENERAL ASPECT.—South Africa is generally composed of long mountain ridges, extending in a direction nearly parallel to the sea-coast, with intervening plains and valleys, which rise by successive stages to the table-land of the interior. Within the colonial territory these mountains consist of three distinct ranges. The first named *Lange Kloof* runs parallel to the south coast, at the distance of from 20 to 30 miles. The second range, named *Zwarte Bergen* Black Mountains, is considerably higher, and more rugged, consisting often of double and even triple ridges. The belt of land between this range and the former, is nearly equal in width to the low land on the sea-coast, but is at a considerably great[illegible] elevation. Beyond another plain of 80 to 100 miles wide, soars the lofty *Nieuwveld Gebirge* Newland Mountains, the highest range of South Africa: the summits of which are generally covered with snow, being estimated to exceed the elevation of 10,000 feet. Farther north, the country begins to fall towards the Orange, and the great part of the region yet explored forms the basin of that great river with its tributaries. The Nieuwveld Gebirge are recognized to the north-west under the name of *Roggeveld Bergen*; eastward, they take the names of *Winterberg* and *Sneeuwbergen*, and are further prolonged in the same direction to an unknown extent, forming, probably, a part of the great range called the backbone of the World. The other two ridges are pronounced, in the same manner, to the north-west, and to the north-east, with frequent interruptions, no doubt, but still with sufficient continuity to warrant us in considering the [illegible] elevations as portions of the same range. The principal summits of these mountains are the *Sneeuwberg* or *Compassberg*, in Graaffreynet, 7[illegible]0 feet; *Komdoorn*, on the border of Beaufort, Graaffreynet, and Worcester, 5[illegible]0 feet; *Kammanassie*, the northern part of Graaffreynet district, 6000 feet: Mr. Martin says from 4000 to 5000; and there is a missionary station within 200 feet of its highest peak. The *Winterberg*, on the eastern frontier, believed to be the highest in the colony, but its height has not yet been ascertained. The plain between the sea and the Lange Kloof is covered with a deep and fertile soil, watered by numerous rivulets, well clothed with grass, and containing a beautiful variety of trees and shrubs. Rains are frequent, and the country enjoys a more mild and equable temperature than the other plains. The plain or terrace, above the Zwarte Bergen contains a considerable proportion of well-watered and fertile lands; but these are mixed with large tracts of arid desert called *karroos*. Above the Zwarte Bergen the third terrace is chiefly occupied by the *Great Karroo*, a vast plain 300 miles long, by nearly half as broad, which is raised about 3000 feet above the level of the sea, and exhibits every where a hard clayey surface, thinly sprinkled over with sand, but studded with isolated hills, and a few stunted shrubs. The eastern portion, however, of this terrace, along the foot of the Sneeuwbergen, is a finely watered and fruitful tract, affording very rich pasturage in its numerous valleys. To the north of the Sneeuwbergen, the country gradually becomes more open, and extensive plains spread before the eye, which are covered with wild animals of every kind. The land declines towards the north, with many insulated hills, which rise abruptly, and stand like sugar loaves upon a table. Further to the north and north-west, along the Cradock river, is an extensive and almost boundless landscape, adorned with natural groves, and opening into extensive plains, covered with long grass, and studded with acacia and in some parts thinly sprinkled with mimosas. Such is the country towards Latakoo, which between that place and Delagoa Bay is described as equally fine. Westward, down the course of the Gariep, the country becomes more and more sterile, and extensive sandy tracts stretch for hundreds of miles on both sides of the river. The country west of the commencement of the Roggeveldt mountains, between 29° and 30° S. lat., appears to be a great inclined plain, the first part fading gradually from the Nieuveldt ridge to the Gariep, sprinkled over with singular piles of rocks which assume the most grotesque appearances. Still further north, these plains are covered with low brushwood with here and there beds of salt; and, in one place, a valley of six miles wide occurs, which is entirely composed of naked salt, and appears to be occasionally covered with water. This vast saltpan is sup[illegible]

* The usual appellations of the southern part of this region are, *The Cape of Good Hope*, or *The Cape Colony*, the most awkward and inappropriate names that can be given to a large country. It is probably not easy to find another; but it has occurred to us that a good designation might be formed from the Portuguese name of the Cape, slightly modified, namely, SPERANZA.

posed to be about 40 miles in circumference; the surface is a fine dry salt, of a brilliant whiteness; and the soil of the country adjoining is composed, in some places, of a sharp gravelly decomposed schistus; in others, of a calcareous stratum strewed over with flints. The western part of this desert is prolonged beyond the colonial limit into Namaqualand, which extends along the coast, on both sides of the Gariep, to about 200 miles north of the river, and for the same distance eastward, in which direction it is separated from the Betchuana country by an extensive tract, which is uninhabitable for want of water. The soil of Namaqualand is in general light, sandy, and thinly clothed with tufted grass. Some plains, however, are reported to be much more fertile in pasturage than the rest of the country; and here and there are scattered copious fountains which afford eligible situations for permanent villages.

At the very southern extremity of Africa is the Cape Peninsula, a singular tract about 36 miles long and 8 broad, composed of a broken series of mountains, with flat or conical summits, which are connected by lower gorges, and joined to the continent by a low, flat, sandy isthmus, 20 miles wide, between Table Bay and False Bay. The peninsula may indeed be said to consist of two mountainous tracts, separated by a sandy isthmus between Haut Bay and Fish-hook Bay. Within the peninsula are several remarkable mountains, the heights and names of which are: *Table Mountain*, 3582 feet; *Devil's Peak*, 3315; *Lion's Head*, 2760; *Lion's Rump*, 1143; *Muyzenberg*, 2000; *Elsey Peak*, 1200; *Simon's Berg* or *Signal Hill*, 2500; *Paulusberg*, 1200; *Constantia*, 3200; *Cape Peak*, 1000; *Hanglip Cape*, 1800 feet. Of these the most conspicuous is Table Mountain, the northern front of which, directly facing Cape Town, and rising from the bay like the ruined walls of a gigantic fortress, presents an almost horizontal line of two miles in length, with a plain at the top of about ten acres in extent. In front are two wings, named the *Devil's Peak*, and the *Lion's Head*, which evidently formed, at one time, a continuation of the table, and have their bases still attached to Table Mountain, at a considerable height. The Devil's Peak is broken into irregular points; but the upper part of the Lion's Head is a solid mass of stone, fashioned like a work of art; and resembling, it is thought, in some points of view, a dome placed on a high conical hill. The flat summit of Table Mountain is occasionally overspread with a mass of white clouds, well known as the *table-cloth*, but the "magnificent apparition dwells only on the mountain's top." This is called the *Table-cloth* by Englishmen, but the French call it *la perruque*, the wig. It commences by a small white or fleecy cloud, which remains for some time stationary over the summit of the Lion's Rump; it then gradually increases until it covers the whole Table, when it becomes a dark grey in the middle, while its edges still remain white. After continuing for some time, it slowly mingles with the atmosphere, until it finally disappears without rain or mist. A strong south-east wind commences immediately after the mountain is completely covered, which often blows in squalls excessively strong, and generally continues for two or three days. It blows very hard through the gap which separates the Table from the Devil's Peak, driving the white clouds in rolling fleeces like wool along the sides of the mountains; ships are frequently torn from their moorings, or bring their anchors home, and are driven out of the bay with all their anchors a-head; but the moment they are outside of the bay, they find nothing more than a single or double-reef breeze. But this phenomenon presents itself only when a strong south-east wind may be expected. Though very rugged, the mountain may be ascended on horseback; the experiment, however, is very dangerous.

Beyond the eastern limits of the British territory, the coast extends in a north-easterly direction to Delagoa Bay. The most southernly portion is possessed by the Caffers, from whom it has received the name of *Caffraria* or *Cafferland*, and forms a tract of country clothed with the finest pasturage, far superior, in general, to that within the colonial boundary. The face of the country evidently improves as it extends farther to the eastward; most of the streams are free from the admixture of saline matter, which is peculiar to those adjacent to, and within the colony, and which renders them not only unpalatable, but in some cases highly injurious. The coast is much bolder than that which skirts the colony; but, respecting the country beyond the mountains, nothing accurate is known. It is said, however, to be highly delightful, abounding with wood and water, diversified with ridges and valleys, and clothed with rich herbage. The mountains which separate it from the Betchuana country on the north, and from the Amakosas on the south, are exceedingly rugged, particularly the former range, which is of a very formidable and rugged character, presenting a succession of the most frightful precipices, supporting, like huge buttresses, the inland plains and deserts. The terrace plain between the two ranges, extending from the colonial frontier to the neighbourhood of Natal, a distance of at least 400 miles, and comprising an area of about 24,000 square miles; and even the whole of the country between the mountains and the sea, to a distance of 200 miles beyond the Amapondas, is unoccupied by man: it may therefore be fairly calculated that the waste lands bordering on Caffraria do not fall short of 40,000 square miles. From the Keiskamma to Delagoa Bay, the sea boundary, is one of the most varied and interesting that can possibly be imagined, presenting every diversity that rich hills and fertile meadows can produce; the mountainous range which separates the sea border from the interior is in some places 6000 feet high.—(*Owen's Voyage*, I. 70.) It is within this fine country where there is such ample room for colonists, that the British Governments have been strongly urged to found a settlement at *Port Natal*; where already a number of Dutch boors from the Cape territory have established an independent state. The country is well wooded with large timber, and watered with upwards of 100 rivers and running streams, some of which are larger than the principal rivers of the Cape Colony. The soil is so fertile as to produce three crops of Caffer and Indian corn in the year. The rains are periodical, and the climate is cooler than that of the Cape, and highly salubrious.

The soil throughout the colony is very varied: in some places it consists of a naked sand, in others, of a stiff clay, and in many parts, of a rich dark vegetable mould. Often the surface appears a dry sand, but on digging to the depth of a few inches, a black mould is found beneath; the stiff clayey soil, sometimes red and sometimes yellowish, is very fertile when irrigated. The east coast-border is generally an alluvial loam, as is the case with many valleys, particularly among the ravines and windings of the Fish river. The surface of the great Karroo is diversified: in many places the soil is a stiff brownish coloured clay; in some parts a bed of sandstone, crossed with veins of quartz, and a kind of ponderous ironstone; in others, a heavy sand, with here and there a blackish loam. Near the bed of the Buffalo river the whole face of the country is covered with small fragments of a deep purple-coloured slate, which have been detached from strata of long parallel ridges. Scattered among these fragments are black stones, resembling volcanic slags, or the scoriæ of an iron furnace. Conical hills, some of which are truncated, stand detached on the plain, and are composed of alternate layers of earth and sandstone. Some flat sandy marshes of the Karroo are overgrown with rushes, and abound with strong salt springs, contiguous to which a kind of salt wort grows in perfection; the surface around its roots is generally covered with a fine white nitrous powder.

Of *Minerals* few have yet been discovered. Indications of coal have been met with at the Kroom river, and in some other places. Near the Bushman's river, in Uitenhage, an extensive vein of alum has recently been discovered, which is particularly beautiful, very pure, and valuable as an article of commerce. At Camtoos bay a rich galena has been found in the sides of a deep glen, in quartzose sandstone of a yellowish colour, which is easily broken. This ore, when assayed by Major Van Dheu, yielded from 200 pounds weight, 100 pounds of pure lead, and 8 ounces of silver. Mineral waters exist in different places: and there are numerous salt lakes and ponds which supply the colonists with that necessary article. There are also several singular salt-pans, some of which are 200 miles

from the sea, and from 3000 to 6000 feet above its level, covered with hard salt, from 5 to 6 inches thick. The largest and finest of these is near the Zwartkops river, where the salt on all sides of the pan is a deep vegetable earth, resting on a bed of clay, and without a trace of salt in its composition.

Along the east coast are found immense heaps of shells, in various places several hundred feet above the level of the sea, and generally in the greatest quantity in sheltered spots. At Saldanha bay is a cave 200 feet above the sea-level, which contains a large quantity of different kinds of shells peculiar to the coast; and behind Table Mountain, at a smaller height, are beds of shells buried under vegetable earth and clay. Seven miles N.E. of Uitenhage, and ten miles from the sea, are immense beds of sea shells, particularly of oysters, the fish of which are petrified.

From the Cape, along the south coast, to Algoa bay, a bank with various soundings projects out to sea, called the *bank of L'Agulhas*. The extreme point is nearly in the longitude of Cape Vaches, 22° E., and 37½° S. lat., about 200 miles from the shore, where it quickly converges, and assumes a narrow conical form, with very deep water at its southern end. It is probably the cause of the strong current which sets to the south and west, and is generally strongest during the winter months, running with the greatest velocity along the edge of the bank, or a little outside of soundings. When opposed by adverse gales a very high sea is thrown up, which sometimes lessens the strength of the current. By keeping on the edge of the bank a ship will be carried 80 miles a-day with an adverse wind, round the Cape into the Atlantic; but towards the shore the rapidity of the stream becomes gradually less, and the sea smoother.

CLIMATE.—In respect of heat, the southern portions of this region enjoy a very mild temperature, which seldom rises above 100° of Fahrenheit. In a meteorological register, kept at Capetown, from September 1814 to September 1821, the greatest heat was found to be 96°, the lowest 45°; the mean annual temperature scarcely 68°; of winter, 61°, of summer, 89°; of the warmest month, 97°, of the coldest, 57½°. In short, it corresponds as nearly to Funchal, in Madeira, in climate as in latitude, though on the opposite side of the equator. The mean annual temperature is the same, with this difference, that the winters are somewhat colder, and the summers warmer. During summer, which continues from September till the end of March, the wind blows from the south-east, and often with great violence. From March till September the north-west wind prevails, and is accompanied by pleasant weather, or rains, which are almost constant in June and July. In different parts of the country, however, the meteorological phenomena are much varied, according to the direction and height of the mountains. In Albany and the eastern districts, the climate much resembles that of England; the mountain tops are occasionally covered with snow, which, however, rarely falls in the valleys; the winter nights are sharp and clear, while the summer heats are moderated either by the sea breeze, or by the currents of wind which are continually at play among the hills and mountains. The climate, generally speaking, is very salubrious, but the weather is neither steady nor always agreeable; nor is it suitable for agricultural purposes. The deficiency and irregularity of the rains are great drawbacks. In the south-western districts rain, in the cold season, is profuse, but in summer it is of rare occurrence, and then the ground is parched up. In some of the northern tracts bordering on the Great Karroo there is sometimes no rain for three years in succession; and even in more favoured districts the rain, when it does come, falls in torrents, and does great damage. Sometimes the south-east wind is at first, besides being excessively hot, loaded with impalpable sand; but as the breeze continues it gradually cools and becomes supportable.

VEGETABLE PRODUCTIONS.—"The vegetation of South Africa is unique, varied, and beautiful. Indeed, there are so many varieties of plants at the Cape, that when Linnæus received a large number of specimens, he remarked to his correspondent,—'You have given me the greatest plenty, but have thrown my whole system into disorder.'" Nowhere can the botanist find a richer and more delightful field for his pursuits than in Southern Africa. The *ericæ* or heaths have long been acknowledged pre-eminent in variety and beauty, flourishing equally on stony hills or sandy plains. An endless variety of frutescent or shrubby plants grows in wild luxuriance, some on the hills, some in the deep chasms of the mountains, and others on the sandy isthmus of the Cape; but it is singular that of the numerous *proteæ*, produced indiscriminately on almost every hill in the colony, the *Protea argentea* is confined to the base of the Table Mountain, and has not been found in any other part of the world. The *Conocarpa* (*Kruipel broom* of the Dutch) grows along the sides of the hills: its bark is used for tanning leather, and its branches serve for firewood. The Palma-christi (castor-oil plant) and the aloe are every where found in great plenty. The dwarf mulberry flourishes, and the myrica cerifera, from the berries of which a firm and pure wax is procured by simple boiling, is found wild in abundance on the heathy sides of the hills. Avenues of oak (durmast) trees, and plantations of the white poplar, stone-pine, and others are to be seen near most of the country houses. The most valuable trees, however, are the stink wood, a kind of quercus peculiar to South Africa, and the geelhout or yellow wood, both of which are excellently adapted for building, furniture, and all domestic purposes: these trees generally attain a height of 50 feet, with a diameter of 10. There is besides a great variety of other useful timber-trees. In the neighbourhood of Grahamstown the curtisidendron reaches the height of the oak, and in the spring produces large clusters of deep scarlet flowers from a dark velvet calyx. It is scarcely possible to imagine the brilliancy and beauty of its appearance, the whole of its branches being covered with blossoms. What in Britain are considered beautiful specimens of geranium, are here treated as garden weeds; the colonists indeed often form their garden hedges of the ivy-leafed geranium. The Karroo is chiefly covered with varieties of mesembryanthemum, crassula, stapelia, and euphorbia, and with tufts or bunches of wiry grass, which expand widely after rain. Several species of the indigo plant grow wild; the cactus or prickly pear thrives; various species of the cotton plant flourish in the eastern districts; the tea-plant has long been reared in the country, but no attention has been paid to its culture, though the East India Company's monopoly (owing to which it was neglected, and tried to be extirpated) is now abolished. Flax yields two crops in the year, and the tobacco-plant is large and of good quality. Of fruit there is every variety belonging to the tropical and temperate zones: oranges, lemons, citrons, figs, guavas, grapes, melons, pomegranates, shaddocks, quinces, jambos, loquats, peaches, nectarines, pears, apples, plums, mulberries, raspberries, strawberries, gooseberries, almonds, walnuts, chestnuts, hazelnuts, are all large, and of excellent flavour. There are also a great variety of grapes; a large white Persian grape (hanenapod or cock's foot) yields a delicious but costly wine; the grapes being fleshy, they are generally reared for the purpose of being converted into raisins. The vine is generally planted at the Cape in rows like gooseberry bushes; in some vineyards, such as Constantia, it is supported on frames, raised a few feet above the ground, or on lofty trellices, along which it spreads in rich luxuriance. On an acre of ground may thus be planted 5000 vines, which will yield 5 leaguers or pipes (560 gallons) of wine. The average wholesale price of the leaguer is 80 shillings. Culinary vegetables of every variety and of the finest quality are grown. The various grains cultivated are now much improved by the introduction of fresh seed from England, India, and Australia; new grasses have been laid down, and the system of turnip husbandry, commenced in the British districts, is extending among the Dutch farmers.

ANIMALS.—In Southern Africa are found some of the largest and also some of the smallest members of the animal kingdom. Among the beasts are the elephant, weighing 4000 lbs, and the black streaked mouse, only a quarter of an ounce; the giraffe, 17 feet high, and the elegant zenik or viverra,

only three inches; the ostrich, 6 feet high, and the creeper, a bird about the size of a cherry. Of the thirty species of antelopes known in natural history, Southern Africa contains eighteen; besides which, there is the largest of the eland or oreas, 6 feet high, together with the pigmy or royal antelope, which is little more than 6 inches. The springbok or leaping antelope is met with in herds of 4000 or 5000. The lion, the leopard, the panther, and various species of the tiger cat are indigenous. The wolf, the hyæna, and three or four different kinds of jackal are every where found; as also the ant-eater, the ironhog or crested porcupine, the viverra, the jerboa, and several species of the hare. Buffaloes are numerous in the woods and thickets; and many of the plains abound with zebras, quaggas, and gnus. In the mountains there are large troops of the dog-faced baboon, and swarms of apes and monkies of all sizes. Of the lion there are two varieties, the yellow, and the brown or black, of which the latter is the stronger and fiercer. Indeed, the strength of this species is prodigious, there being well authenticated accounts to prove that one can carry off an ox or a horse with nearly as great ease as a fox carries a goose. Elephants are met with in the eastern districts, and are more numerous as the country advances eastward. There are also two distinct species of the double-horned rhinoceros; and hippotamuses are numerous to the eastward, and as large as those of the Upper Nile. Birds exist in great variety; ostriches are numerous: the secretary bird (falco serpentarius) is peculiar to the Cape; it is the inveterate enemy of snakes, and on that account much cherished. Eagles, vultures, kites, pelicans, flamingoes, cranes, spoonbills, ibises, wild geese, ducks, teal, snipes, bustards, partridges, turtle-doves, thrushes, and humming birds of every sort are found in abundance. Many other beautiful and curious birds might be mentioned, but we have only room to notice two of peculiar character. The locust-bird, a species of thrush, congregates in places where locusts migrate, and feeds upon the larvæ of the insect. In 1828, Albany was overflown, and almost every vegetable substance consumed by locusts; but in a short time these were followed by myriads of locust-birds, which speedily cleared them off. The honey-bird, which is rather larger than a sparrow, is used by the natives for a singular purpose. When the Hottentots are in want of wild honey they go to a place which they think likely to contain the hives, and by a kind of whistle summon the honey-bird, which is always lurking in the neighbourhood. The bird soon appears, and actually guides the hunter to the very spot where the honey is deposited; he then takes his station on a bush, and waits till the honey is secured, when he becomes possessor of the vacant nest, and the share of the spoil which is invariably left for him. When the bird has eaten his fill, the hive is again closed with stones to prevent the badger from destroying the young bees; and, as there is always a plentiful supply of flowers, the bees, however often robbed, never suffer from hunger, nor do they sting unless when hurt. Ants are very numerous; but the visitations of the locust are now rare. Reptiles are not numerous; snakes are found, but few accidents from them occur. The boa constrictor of a large size has been killed near Natal, and also a new species of alligator; large crocodiles have been seen at Delagoa Bay. Fish are extremely abundant, and of every kind, in the bays and along the coasts. During the winter season, whales, porpoises, and sharks enter the bays, and seals and penguins frequent various parts of the coast.

Of domestic animals, the colonists possess those of Europe in abundance. The Cape horse is not generally large, but it is very hardy. The ox is large and clumsy, in consequenceof his wide branching horns and great limbs, and is of considerable strength. A stall-fed Cape ox weighs from 800 to 900 lbs. Dutch without the offal; the beef is excellent, if the animal has not been driven far without food across the Karroo. The Cape sheep are long-legged, small-bodied, thin in front, and have all their fat collected upon the tail and the hind part of the thigh. The tail is short, flat, naked on the under side, and weighs from 6 to 12 lbs. The fat when melted is like a vegetable oil, and is used by the Dutch as a substitute for butter, and by the English for making soap. The general weight of the sheep is from 40 to 60 lbs; the wool, if it may be so called, is a strong frizzled hair, which drops off in September and October, and is scarcely fit even for stuffing cushions. Merinos are now becoming extensively introduced. The Namaquas possess the handsomest and most vigorous breeds of domestic animals in Southern Africa. The oxen are equally strong as those of the colony, but are trained into three different classes; beasts of burden or draught, saddle oxen, and war oxen. The saddle oxen are much superior to the horse in supporting fatigue, but are inferior in swiftness. The war oxen seem peculiar to this nation. They are chosen from the most savage and ungovernable, and, being driven against the enemy, rush on them like wild bulls; they will even attack wild beasts.

PEOPLE. — Of the white inhabitants of the colony, the most numerous are the original European settlers, or their descendants, termed *Africanders*, and consist chiefly of Dutch, with a small intermixture of French Protestant refugees who left their country after the revocation of the edict of Nantes. In physical structure the Cape Dutchmen are a fine race; in some districts their stature and strength are gigantic; particularly on the frontiers, where little vegetable food is consumed, and where mutton stewed in sheep's-tail fat is the principal food throughout the year. In mental attainments they are by no means deficient, when they are educated in youth, and when a proper stimulus is given to the development of their talents. In the interior of the country corpulence is one of the chief beauties of a Dutch housewife; and the men are distinguished alike for their hospitality and bravery. Those who live by grazing, termed Vee Boors, are now the most numerous, and, probably, the wealthiest class. A numerous colony of British settlers was established in Uitenhage, Somerset, and Albany, on the eastern frontier of the colony in 1820. The other British colonists are principally confined to Capetown, or engaged in trade at different stations. Their character is similar to that observed in other colonies; shrewd, generally intelligent, attached to political liberty, careful of preserving it, hospitable, and enterprising.

The liberated slaves form the next most numerous class. They amount to 35,000, and may be divided into three classes: Malays, Negroes, and Africanders; the last being a mixed race, descended from a European man and a Malay or Negro woman. These classes keep themselves perfectly distinct, and will not intermarry. Many of them are nominally Christians; but the prevailing creed of the Malays is Islam.

The *Hottentots*, the aborigines of the country, are the next in number, but the least in importance and social worth, in the opinion of many of the colonists. At present, after two centuries of oppression, they probably do not amount to 30,000. When young they are clean-limbed, and well proportioned; with joints, hands, and feet remarkably small. In some the nose is flat, in others it is raised; the eyes are of a deep chestnut colour, very long, narrow, and distant from each other. The eyelids are rounded into each other exactly like those of the Chinese. Their complexion is a clear olive or yellowish brown; and the hair of the head grows in hard, knotted tufts, and when left to grow, hangs on the neck in hard twisted, fringe-like tassels. Their cheek bones are high and prominent, forming with a narrow pointed chin nearly a triangle; their teeth are small, and exquisitely enamelled. The tending of cattle is their principal occupation in the colony; and for this purpose they hire themselves to the farmers. Some are employed as waggon-drivers, in which capacity they are very skilful, driving sometimes eight horses with perfect ease, over bad roads, avoiding every hole and rut, and going at a smart gallop. Their fidelity and honesty, when well treated, entitle them to rank with any Europeans. Their habits of life, however, are filthy and slovenly. Their villages, or kraals, form a confused mass of little conical huts, reared of twigs and earth, and so low that the inmates cannot stand upright. They carry on various little manufactures, such as tanning and dressing skins, form-

nation, equalling the Murutsi in industry, and far surpassing them in wealth and numbers. They are known to all the southern tribes, as the people from whom all other nations receive their iron and copper wares. All, indeed, of the South African tribes to the south of Inhamban habitually regard each other as members of the same family; they are, as they express it, one people, and, unless when war disturbs their harmony, mingle together without fear or mistrust. The industrious tribes of the interior are not insensible to gain; the mercantile character is fully developed among them; and they think of nothing, says Mr. Campbell, but beads and cattle. Their trade may be traced from Delagoa Bay on the eastern, to Whale-fish Bay on the western coast; and from Litakoo northwards to the Zambeze. The most southern tribe of the Betchuanas is the *Eatclapis*, whose chief town is *Litakoo* or *Lutakoo*, situate about 27° 6′ S. lat., 24° 40′ E. long., with a population variously estimated at from 4000 to 10,000. Its situation, however, has been several times changed within the present century; and *Kruman*, or *New Litakoo*, is the principal missionary station. Eastward from the Batclapis are the *Tammahas*, whose chief town is *Mashow*, 190 miles, or thereabouts, E.N.E. from Litakoo, and containing about 10,000 or 12,000 inhabitants. North-east of the Tammahas are the *Murutsi*, whose chief town is *Kurrichane*, about four times the size of Litakoo. West or north-west of the Murutsi are the *Wunkitsi*.

The *Zoolahs*, who live to the south-westward of Delagoa Bay, and round Port Natal, are a remarkably neat, intelligent, and industrious people, rich in cattle, cultivating a fine country, and inhabiting large towns. They were originally few in number; but have spread their conquests over a large territory, and now form a nation composed of all kinds of tribes. They are, generally speaking, of a more ferocious character than the southern Caffers, and also more powerful; but there is now a desert tract of 180 miles interposed between the Zoolahs and the Amapondas. Of late years, however, a great number of Dutch boors or farmers, discontented with the British government of the colony, have passed the frontiers to the north-east, and, after fighting their way through the intervening tribes, have established themselves, as an independent people, in the country of the Zoolahs, at Port Natal. Their chief town is *Pietermauritzburg*.

TERRITORIAL DIVISION OF THE CAPE COLONY. — The colonial territory is divided into two provinces, named the Western and the Eastern, the latter of which is under the charge of a lieutenant-governor. These provinces are subdivided into districts, as stated in the following Table:—

Provinces.	*Districts.*	*Area in sq. miles*	*White Population.*	*Black Population.*	*Total Population.*	*Chief Towns.*
Western.	Capetown, ...	5½	14,041	5,702	19,743	Capetown.
	Cape District,	3,584	8,270	4,910	13,180	Simon'stown.
	Stellenbosch,..	2,280	7,120	9,858	17,884	Stellenbosch.
	Worcester, ...	24,100	6,025	3,489	9,514	Worcester.
	Clanwilliam,..	18,011	7,000	1,015	8,015	Clanwilliam.
	Swellendam,..	9,000	13,345	3,314	21,859	Swellendam.
	Beaufort, ...	20,000	2,916	2,872	5,908	Beaufort.
	George, ...	4,545	3,676	4,517	9,193	Georgetown.
Eastern.	Colesberg, ...	—	2,100	—	2,100	Colesberg.
	Albany, ...	1,792	11,500	228	11,728	Bathurst.
	Somerset, ...	7,168	11,900	1,760	13,660	Somerset.
	Graffreynet,...	22,000	7,531	7,407	14,938	Graffreynet.
	Uitenhage,....	9,000	4,628	6,391	11,019	Uitenhage.
			100,053	51,463	158,741	

GOVERNMENT. — The affairs of the colony are administered by a Governor, who resides at Capetown, aided by an executive council, which is composed of the Commander of the Forces, the Chief-Justice, the Auditor-General, Treasurer, Accountant-General, and Secretary to Government. There is also a legislative council, appointed by the British Home Government. The eastern districts have been lately placed under the superintendence of a Commissioner-General, who resides at Uitenhage. Each district or drostdy has a civil commissioner, who acts also as a resident magistrate, and is aided by a number of unpaid justices of peace: a district is subdivided into a number of smaller divisions called veld-cornetcies, over each of which a veld-cornet, a sort of petty magistrate, presides. He receives no salary, but is exempt from all direct taxes.

When the Cape became a British colony the Dutch civil and criminal laws were in operation; but these, particularly the latter, have undergone considerable modification. The laws are administered by a supreme court, consisting of one Chief and two Puisne Justices; and for the better execution of the law, sheriffs and deputy-sheriffs of districts have been appointed since 1828.

RELIGION. — There is a variety of creeds among the Christian part of the population; the most numerous body being the Calvinists or adherents of the Dutch Reformed church. Missionary societies have also been long labouring in the attempt to convert the Hottentots and Caffers, and in some places have met with considerable success. The South African Missionary Society confines itself to Capetown; the London Missionary Society has stations at Capetown, the Paarl, Tulbagh, Bosjesveldt, Zuurbraak, Pacaltsdorp, Hankey, Uitenhage, Bethelsdorp, Port-Elizabeth, Theopolis, Grahamstown, Graffreynet, Kat river, Buffalo river, Cafferland, Philipolis, Bushman station on the Caledon river, Griquatown, Betchuana Mission, New Litakoo, Komaggas in Namaqualand, and Steinkoff. These stations employ 32 missionaries or pastors with several schoolmasters and assistant teachers. The Wesleyan missionaries are stationed at Capetown, Kamiesberg, and in Great Namaqualand, Grahamstown, Salem, Bathurst, and Port-Francis in Albany district, and among the Caffers and Betchuanas. The Moravians have stations at Gnadenthal, Groenenkloof, Enon, Hemelenarde, Elim, and Shiloh, which employ 39 missionaries.

STAPLE PRODUCTS.—Corn, wine, wool, provisions, oil, aloes, and fruits are the staples of this fine colony; but many other articles are either produced in the colony or obtained from the neighbouring nations. There is an annual exportation of corn to a considerable amount, which brings, as flour, a higher price at the Mauritius and other markets than the best American. Barley, oats, and Indian corn thrive well; the last is admirably adapted for fattening swine, the export of which, in the shape of hams, bacon, and salt pork, is yearly increasing. Two crops of potatoes are raised during the year, which are of a succulent yet mealy quality; and the nutritive property of every article of provision is abundantly exemplified in the fat and healthy appearance of the people. Wine has long been a staple export. The culture of the vine was introduced by the French Protestant refugees, and wherever the quality has been attended to, the wine produced is equal to that prepared in any other part of the world; but the vine growers have unfortunately been hitherto more attentive to the quantity than the quality of their wines, so that they are of very little repute in the European markets; and the reduction of duty on foreign wines imported into Britain since 1825, has almost ruined the Cape wine-trade. Constantia, near Capetown, was long celebrated for a peculiar and excellent wine. Wool will, in time, be one of

INTERNAL COMMUNICATIONS.—There are few roads; and the comm
country is almost entirely obstructed by the numerous mountain ranges, th
are tremendous. A comparatively easy access from Capetown is to be fou
of land between the western coast and the mountains of the Cape and St
the districts of Clanwilliam, Worcester, Beaufort, and Graffreynet, to say
in a manner shut out by the difficulties which the mountains present. To
rier between the Cape peninsula and the eastern districts, two works have
and completed to the incalculable advantage of the colony. The first is
through French Hoeck Pass; and the second, called Sir Lowry's Pass, was
Governor, Sir G. L. Cole, in 1830); farther east this road passes through
from which there is an excellent natural path as far as the village of Geor
town. The French Hoeck Pass leads to Worcester; but the roads beyond
could be improved only at an enormous expense. Every one who has re
other travellers of note, must have been appalled at the very description of
waggon by the old Hottentot Holland Kloof, and will feel pleasure in lear
passed at a brisk trot over as good a road as any in England. Indeed, bu
the communications throughout the country would be easy, for, with the
spots of inconsiderable extent, the surface of the ground presents a good
a crust of ironstone gravel, over which travelling may be performed at the
on horseback, from five to five and a half in a horse waggon, and three in
—(*On the Roads and Kloofs in the Cape Colony, by Major C. C. Mitchell*, Sec
R. Geog. Soc. Lond. VI. 168.)

RIVERS.—The GARIEP or GARIEP* (Great River) has its principal sour
the north-westward of Port Natal, and is formed by the union of two great
Gariep, and *Ky* (yellow) *Gariep*, which meet a little to the south of 29° S.
E. long. The Nu-Gariep has its origin at the head of a long valley, which is
Mountains and the Maritime Chain, 70 miles N. of Port Natal; and, after a
to the south-west, is joined by the *Caledon*, which rises on the opposite or n
mountains. The Ky-Gariep rises among the mountains, about 27° S. lat.,
E. long.; but its principal affluent, the *Donkin*, seems to have its sources nea
and the Caledon. From the point of confluence the united stream of the
entering the Atlantic Ocean, in lat. 28° 30' S. long. 16° 30' E. Its mouth is
be scarcely accessible for boats, and its course for several hundred miles is
falls and rapids; and, from Griqua town almost to the ocean, a distance of
ned on its northern bank by a parallel ridge of mountains. In 22° E. long.
between the mountains which approach on both sides, where the river forces
hills, arched over to a considerable extent by immense cliffs; and the roar
tinctly heard at the distance of many miles. Another magnificent fall occur
river is hurried over a rock 400 feet in height, its breadth, which above is iro
narrowed to a space of scarcely 100 feet. This was named *King George's Ca*
who discovered it in 1824. Besides the Caledon and the Donkin, the other p
Great Fish River, which drains the northern slopes of the Middle Roggevel
near 21° E. long.; the *Brak*; the *Zeekoe* or *Sea-cow river*; and the *Hart* or

The *Olifant's (Elephant's) River* flows in a northerly direction, along
mountains, and falls into the Atlantic in 31° 30' S. lat. It is the only river
navigable with boats for more than 30 miles from the sea, to which distance
The mouth is barred by a reef of rocks and a sandbank, which leave between
open, and through which whale-boats enter for water and provisions. The
falls into St. Helena Bay. The *Brede* river falls into St. Sebastian's Bay, w
wide at its mouth. The *Gauritz*, formed by two branches, the Big and the Li
Nieuveldt mountains, and flows into the Southern Ocean, between the distr
George. Its principal affluents are the *Buffel's* Buffalo), the *Four*, and the
formed by the union of the Kamanka and the Zuid (Sale), flows through Vilan

situate at the north end of Cape district, is a large semicircular bay, with good anchorage, and well sheltered from the south and east, but exposed to the north. Its mouth is 9 leagues wide, and the bay is 4 leagues deep, with regular soundings from 20 to 4 fathoms towards the southern shore. *Saldanha Bay*, one of the best and most commodious harbours in the world, is situate in 38° 8′ S. lat., 17° 55′ E. long. It extends about 25 miles from S.E. to N.W., with a comparatively narrow entrance, not quite 3 miles wide, which is forced through a ridge of hills, and on the north-west side, is divided into two channels, by either of which it may be safely entered. It affords at all seasons very excellent shelter and anchorage. *Table Bay* is situate at the north end of the Cape peninsula, and opens to the north-west. It affords secure shelter from September till May, and is the chief naval station at the Cape during that portion of the year. *Hout Bay* and *Chapman's Bay*, two small openings on the west side of the peninsula. *False Bay* is a large and nearly square gulf, about 30 miles deep and as many wide, opening to the south, and forming the south-east side of the Cape Peninsula, and south side of its isthmus. On its west side is *Simon's Bay*, the naval station during the winter months. *Mossel Bay* and *Plettenberg Bay*, are both in George district; the former is, next to Simon's Bay, one of the safest havens to the east of the Cape, and is capable of receiving vessels of every kind; the latter, 400 miles from the Cape, is equally safe, eligible, and commodious, affording safe anchorage in 8, 9, and 10 fathoms water, particularly during strong N.N.W. gales. The fine harbour of the *Knysna*, a little to the west of Plettenberg's Bay, would contain fifty large ships secure from all winds, but the entrance is narrow and intricate. *Algoa Bay* includes all the coast between Capes Recife and Padron or Padrao, and is the chief haven of the eastern districts, one of the winter harbours of the colony, and a free port. It opens widely to the south-east, but during winter (from 1st April to 1st September) the wind scarcely ever blows from that quarter; in some seasons, however, the surf rolls in with great violence. *Port Natal*, on the east coast of Cafferland, in 29° 55′ S. lat. and 31° 28′ E. long., is an exceedingly fine harbour, but the entrance is narrow, and contains a bar of shifting sand. There are, however, 6 feet water on the bar, with a run of 6 feet, and at spring tides 14 feet of water. *Delagoa*, or correctly, *Aluguoa Bay (Bahia da Alagoa)*, called also by the Portuguese *Bahia de Lorenço Marques*, and *Bahia Formosa*, is a large bay opening widely to the north-east, between 25° 34′ and 26° 22′ S. lat. The south-east side is formed by a long peninsula or jutland, terminated by the islands called the Great and Little Inyak.

Islands.—*Robben* or *Penguin Island*, at the mouth of Table Bay, 5 miles N. of Green Point, is six miles in circumference, with sunken rocks and breakers along its west and south sides. But there is no danger for more than two cables' length from the island, except from a sunken rock called the *Whale*, which is a mile to the southward. The island contains several springs of good water, and produces a few grapes and culinary vegetables. It is a great resort of penguins and quails during their breeding season, and a depot for convicts, who are employed in quarrying limestone and excellent blue flags streaked with white, which are used in Capetown. *Dassen* or *Coney Island*, 10 leagues N. and W. of Green Point, and 8 to the southward of the entrance of Saldanha Bay, is about 6 miles in circumference, with little elevation and a sandy surface. The shore is foul and dangerous on the south and west sides, but bold and clear of danger on the north and east, where good anchorage may be found close to the land. The passage between the island and the mainland is entirely free of danger two cables' length from either shore. Its only inhabitants are penguins and gannets. *Seal Island*, and *Noah's Ark*, are in False Bay. *St. Crux Isles*, *Bird Islands* or *Chaos*, and *Doddington Rock*, in Algoa Bay. The Chaos are rendered famous by their being the termination of the voyage of Diaz, in 1486, who got thus far eastward without seeing the Cape; the Doddington Rock, which lies 3 miles S. from the Chaos, is so named from the Doddington Indiaman having been wrecked upon it in the year 1755. *Inyack* lies on the east side, and *Shefeen* islands on the west side of the mouth of Delagoa Bay.

Capes.—The Cape of Good Hope is the south-western extremity of Africa, and is situate in 34° 23′ 40″ S. lat. and 18° 32′ 25″ E. long. It is formed by a peak 1000 feet high covered with piles of huge stones, loosely thrown together as if giants had been at play, and presents a perpendicular cliff to the ocean. *Cape L' Agulhas* (Needle Cape) is however the most southern point of the continent, projecting as far south as 34° 52′ S. lat, a little to the west of 20° E. long. *Green Point* is the western extremity of Table Bay, on which a lighthouse was erected in 1825, two miles N.W. from Capetown. *Cape Hanglip*, the south-east point of False Bay. *Cape Recife*, a long and low spit of rocks and sandhills, forms the south-western point of Algoa Bay. *Cape Vidal* in Cafferland, 28° 9′ S. lat. *Cape Veltas*, about six miles to the S. of the mouth of the Gariep, in 28° 27′ 30″ S. lat., 16° 17′ E. long, is a high bluff point, with rocks running about half a mile out to sea, beyond which there is no danger. Cape *Padron* or *Padrao*, at the east side of Algoa Bay, is so called from its having had a pillar erected upon it by Bartholomew Diaz in 1486. Cape *Inyack* or Cape St. Mary, the south-east point of Delagoa Bay.

Towns, &c.—Capetown (Kaapstad of the Dutch) is situate on the south side of Table Bay, at the foot of Table Mountain, on a plain which rises with an easy ascent. It is regularly built, with straight and parallel streets, crossing each other at right angles, and shaded with elm or oak trees. The houses are mostly of red-brick or stone, of a good size, and generally have a stoup or terrace before the door, shaded with trees, beneath which the inhabitants, British, as well as Dutch, delight to lounge, sheltered from the sun, or to inhale the fresh evening breeze. The squares are well laid out, the streets are extremely clean, and the public buildings numerous and substantial. Throughout the week there is a continual busy hum of industry; and on the Sabbath the sounds of the church bells, and the groups of well-dressed people flocking to their respective places of worship, readily make the traveller forget that he is at the southern extremity of Africa. The castle, on the south-east side of the town, is a strong fortification commanding the anchorage; and, if well defended, is capable of a successful resistance to any force which may be brought against it. It is pentagonal, with a broad ditch and regular outworks; and contains most of the public offices, and barracks for 1000 men. There are several other defensive works, and the anchorage is commanded by a battery called the Mouille. A plentiful supply of excellent water is brought to the town in pipes, and distributed to every part of it; ships' boats are supplied at the landing-place with a beverage equal to that of the Thames. The population exceeds 20,000, of whom more than half are white; and of these the majority are Dutch. An institution, called the South-African College, was founded at Capetown in 1829; its affairs are under the superintendence of a council and senate; and it has professors of mathematics, astronomy, classical, English, Dutch, and French literature, drawing, &c. There is also a South-African literary and scientific Institution, with a museum attached to it; a South-African public library; a Medical Society; a Royal Observatory, and several religious and benevolent societies.

The other towns of the colony are generally mere villages. The only large town is *Grahamstown*, in Albany, situate on the Kowie river, 650 miles east of Capetown, and 100 from Port-Elizabeth on Algoa Bay. It contains about 700 houses, about 3000 inhabitants, two public libraries, a printing office, and several excellent public buildings and institutions. *Port-Elizabeth*, in Uitenhage, on the coast of Algoa Bay, three miles north of Cape Recife, is rapidly rising in importance, and being a free port, bids fair to rival Capetown. *Uitenhage*, the capital of the district, is also a neat and flourishing town, built on a large and well-watered plain, 600 miles from Capetown. *Cradock*, in Sco

nearest district, on the direct road to the Cogha and Bethlehem committee, is that township, a
taine 300 inhabitants. *Graaf-Reynet* is situate on a sort of basin, almost enclosed by the deep ch
the Sunday river, closely environed by an amphitheatre of steep rugged hills, and contains ab
houses, almost all neat and commodious brick buildings, with wide straight streets, which are
with rows of lemon and orange trees. Population between 2000 and 3000. *Port-Beaufort*, at the
of Breede river, in Swellendam district, enjoys a considerable coasting trade. *Georgetown*, in
district, is pleasantly situate on a large plain, seven miles from the sea, is divided into several
with handsome houses, and is rapidly improving. *Bathurst*, in Albany, occupies an elevated s
miles inland from Port-Francis, and was intended for the capital of the district.

HISTORICAL EVENTS.—The Cape of Good Hope was discovered in 1486 by Bartholomew Di
1650 two commanders of the English East India Company took possession of the country
name of King James; but no settlement was then formed. In 1650 it was colonized by the
Government, and remained in their possession for 195 years. In 1795 it was taken possess
by a British armament, but restored to the Dutch in 1802. In 1806 it was again taken by the
and confirmed to them at the general peace in 1814.

THE ISLANDS OF AFRICA.

MADAGASCAR, in the Indian Ocean, about 240 miles from the coast of Mozambique, between 12° and 26° S. lat., and 44° and 52° E. long., is 930 miles in length, by from 70 to 330 in breadth, and contains an area of about 235,000 square miles. The population has been estimated at 4,700,000. Along the east coast extends a margin of low land from 20 to 30 miles in breadth, and along the west coast a similar margin, from 70 to 100 miles broad, and between them is an elevated country, consisting of extensive plateaux, running north and south, diversified with hills, luxuriant valleys, passes, and ravines, craters of extinct volcanoes, forests, savannahs, rivers, and lakes, while almost every part of the coast, particularly the western, is indented with spacious harbours and bays, some of which are 50 miles deep, with soundings in every part, and sheltered from every wind. Though the island is not traversed by any continuous chain, yet many parts may be called mountainous; the highest point, *Ankaratra*, lat. 19° 40′ S. long., 47° 20′ E, is about 11,000 feet above the level of the sea. The most fertile portions are the valleys, most of which produce rice and other vegetables, or are clothed with a rich and luxuriant verdure. The climate is extremely diversified: that of the coast is oppressively hot, while in the interior the temperature seldom exceeds 85°. The heat at Tananarivo, the capital, ranges from 40° to 85°; the middle of the day is often extremely sultry, but the mornings and evenings are always pleasant. The climate of the coasts is very prejudicial to Europeans, but in the central regions, it is much less so. The weather on the coast is usually hot, damp, and rainy; but in the interior, the rains are periodical. The trade winds from the east and south-east prevail during the greater part of the year; while the rains are often accompanied by violent gales from the north-west, west, and south-west. Earthquakes are sometimes felt. The soil in many parts is prolific, and highly susceptible of improvement; and the island produces many valuable plants, including both those of tropical and those of temperate climates. Among the animals may be mentioned five varieties of the monkey, foxes, wild dogs and cats, hogs, goats, cattle and sheep similar to those of South Africa, crocodiles, serpents, some of which are of large size, lizards, scorpions, and centipedes, parroquets, flamingoes, falcons, kites, turtle-doves, pigeons, turkeys, and particularly bats of large size. The sea abounds with fish, and oysters are plentiful on the coast. The people are all comprised in one empire, form one nation, and speak various dialects of the same language: but they appear, nevertheless, to be descended from different original stocks. The distinction of colour separates them into two great classes, one of which are olive coloured, have handsome features, graceful persons, and lank dark hair, while the other and more numerous class closely resemble the Papuans, being short and stout, almost black, with low foreheads, broad flat faces, large eyes and mouth, and long crisped hair. With the exception of the Ovahs, who belong to the first class, and live in the interior, the Madegasses are little better than barbarians, go almost naked, despise a settled life, are extremely superstitious, and practise most of the vices so generally prevalent among the savages of the adjacent continent. Their diet consists principally of rice and manioc, with beef and poultry, and their cookery is extremely simple. Madagascar is divided into 28 provinces, each having a separate chief; but latterly the Ovahs have become the prevailing tribe, and their chief, who is in fact sovereign of the island, receives tribute from all the rest. The government is despotic, and the succession usually hereditary, though the king has the right of appointing his immediate successor, and of settling the line through future generations. The royal family are highly honoured, and no people can be more tenacious of etiquette than his subjects, and of the respect due to rank. The sovereign is also high priest of the national religion, which is a rude species of polytheistic idolatry. Christianity was introduced with some success by English missionaries between 1818 and 1830; but a royal edict, in 1835, not only forbade the profession of it, but legalised the persecution of all its adherents. Within the present century the whole island was reduced to subjection by Radama, chief of the Ovahs, who proved himself to be a wise and enlightened prince, anxious for the improvement of his country, and the civilization of his subjects; but since his death, and the succession of his queen to the sovereignty, there has been a stagnation in the trade with England, the missionaries have been driven from the island, and every means adopted to destroy the effects of their past exertions in the promotion of religion and social improvement. The capital is *Tananarivo*, situate on a lofty table-land, nearly in the centre of the island. *Tamatave* on the east coast, is also a place of considerable importance. The capes of the island are *St. Mary*, the most southerly point, and *Cape Ambro*, the most northerly; *Cape East*, on the north-east coast; *St. Sebastian* and *Manambaho* or *St. Andrew* on the north-west. The principal bays are those of *Antongil*, north-east, and *St. Augustine*, south-west.—(*Ellis's History*. Lond. 1837.)

The Comoro Islands are four in number, situate midway in the channel between Cape Delgado on the continent, and the most northerly part of Madagascar. They are high and mountainous in the interior, but the lower grounds abound in sheep, cattle, and all kinds of tropical grains and fruits. The people are mild and industrious. *Comoro*, the largest, is 90 miles in circumference, and contains about 30,000 inhabitants, who speak Arabic, and profess Islam. It contains a mountain peak, supposed to rise 6000 or 7000 feet above the level of the sea. *Anjouan* or *Johanna* is the most flourishing. The other two, *Mohilla* and *Mayotta*, are comparatively small.

BOURBON, 440 miles E. of Madagscar, between 20° 50′ and 21° 24′ S. lat., is 40 miles in length, by 27 in breadth, of an oval form, and contains about 900 square miles. It is divided into two parts by a chain of mountains, running north and south, and connecting two volcanic groups, or centres of volcanic action; the one of which, in the north, the *Piton des Neiges*, rises 10,355 feet above the level of the sea; the other, in the south, the *Piton de Fournaise*, is an active volcano of 7218 feet in height. There are no plains of any extent; the shores are not high, but there are no safe roads, nor any harbours. The climate is healthy and agreeable, especially on the eastern or windward coast. The atmosphere is pure, and the sky generally clear, though this tranquillity is sometimes disturbed by violent hurricanes. From December till May is the hot and rainy season, when the mean temperature is 80°; during the rest of the year the mean temperature is 76°. The soil is very fertile, particularly near the shore, where the cultivated land forms a belt round the island, ascending the mountain slopes in some places to the height of more than 3000 feet. The sugar-cane is extensively grown, about a fourth part of the cultivated land being so occupied; coffee also in small quantity, cloves, cacao, and tobacco. Wheat, rice, and maize are raised, but to the extent of less than a fourth part of the quantity required; potatoes, beans, and other leguminous plants, and a great variety of fruits succeed remarkably well; and manioc forms the staple food of the blacks. In 1837, there were on the island 32,240 swine, 6500 deer and goats, 5350 horses, and about 15,000 mules, sheep, and oxen, in nearly equal numbers. The coasts abound with fish, large turtles, coral, and ambergris. The population, in 1836, consisted of 36,803 free colonists, and 69,296 slaves, of whom 57,346 were employed in agriculture. The free colonists are of French extraction; the slaves are African, mostly from Madagascar; the latter are in general humanely and kindly treated. Bourbon contains a college and numerous schools, 16 churches, 2

hospitals, 2 poor's houses, and 2 prisons. Four newspapers are published in the island. *St. Denis*, the chief town, contains a public library, and about 12,000 inhabitants. *St. Paul*, the second town, contains 10,000 inhabitants; but neither of them possesses a harbour, and vessels have to lye in open and exposed roadsteads. Bourbon was discovered in 1545 by Mascareenhas, a Portuguese navigator, whose name it bore till the French took possession of it in the next century, and gave it its present name. It has a governor sent from France; and is one of the principal colonial possessions of that country.

MAURITIUS, or the ISLE OF FRANCE, situate in the Indian Ocean, 80 miles E.N.E. of Bourbon, between 20° and 21° S. lat., is of an elliptical form, 44 miles N.S., 32 E.W., and contains 423,680 acres or 676 square miles. It seems to be of volcanic origin; the rocks are disposed in strata, which rise from the sea, and form, in the centre of the island, a high plain. The mountains form three principal ridges, from 1800 to 2800 feet above the level of the sea; and their summits are in general pointed like cockscombs. A coral bank surrounds the island, at the distance of a quarter or a league from the shore and the islets on the coast are all of coral formation; but there is no trace of a crater. The soil is in many parts exceedingly rich; in some places it consists of a black vegetable mould, in others of a bed of solid clay or quaking earth, into which a stake of ten feet may be thrust without resistance. The climate is salubrious. Owing to the purity of the atmosphere the sky is of intense blue; and the mountains stand out in bold relief. The richest and rarest plants of the East have been naturalized, and most of the plants, trees, and vegetables of Europe have also been introduced. The principal branch of cultivation is the sugar-cane, and sugar forms about seven-ninths of the value of the exports of the island, the total amount of which in 1836 was £903,568. The white population are mostly of French extraction, and amounted in 1836 to 20,411; the blacks, in the same year, amounted to 53,791. The white and the coloured or mixed races are distinguished for their high spirit, talent, energy, and industry. The British residents are few in number, and chiefly merchants, soldiers, or government servants. The island was discovered in 1505 by the Dutch, who gave it its present name in honour of their stadtholder, Maurice Prince of Orange; it was subsequently taken possession of by the French, and raised to a naval station of the first importance. It was named the Isle of France, and became the capital of their possessions in the Indian Seas. Having become, during the war of the revolution, a resort of privateers, who infested the Indian Ocean, and committed great depredations on the British trade, it was attacked and captured in 1810 by a force from India; and at the subsequent peace in 1814, the island was confirmed to Britain. The capital is *Port Louis*, a very neat town, with 26,000 inhabitants, has well supplied markets, and excellent water. The only harbours are that of Port Louis on the west coast, and *Malebourg* or *Grand Port*, on the S.E. Dependent on the government of Mauritius are the small islands of *Rodriguez*, *Seychelles*, *Diego Garcia*, and others. Rodriguez, 300 miles E. of Mauritius, is 26 miles long and 12 broad, mountainous, and inhabited by a few French colonists. On the north side is a bay, with excellent anchorage, secure shelter for ships of all sizes, and abundance of wood and water. The air is delightful, the water pure, and the vegetation luxuriant. The *Seychelles* or *Mahe Islands*, between 4° and 5° S. lat., and 54° and 57° E. long., consist of *Mahe*, containing 30,000 acres; *Praslin*, 8000; *Silhouette*, 5700; *La Digue*, 2000; *Curieuse*, 1000; *St. Anne*, 800; *Cerf*, 400; *Frigate*, 300; *Mariane*, 260; *Conception*, 130; *Felicité*, 300; *N. Island*, 800; *Denis*, 200; *Vache*, 200; *Aride*, 150; total, 50,120 acres; besides more than fifteen others of a smaller size, all resting on a coral bank, which surrounds them to a great extent; but all the islands are themselves composed of granite. They possess many excellent harbours, and never being visited by tornadoes, their neighbourhood is much frequented by whalers. The vegetation is extremely luxuriant, and the inhabitants carry on a lucrative trade in numerous small vessels, with India, Mauritius, and Bourbon. The most extraordinary vegetable production is the Coco de mer, a kind of palm, which grows only on Praslin and Curieuse, and has refused to grow, after repeated trials, on any of the others. The islands are very healthy. The *Seychelles* and the *Amirante Islands*, a low and insignificant group to the S.W., at the distance of 80 miles, are under the charge of an agent from the Mauritius, with 25 soldiers.

SOCOTRA, a large island, east of Cape Guardafui, at the entrance of the Gulf of Aden, is 70 miles in length, and 19 in breadth, and may be described as a pile of mountains, surrounded by a low plain. The soil is hard and not susceptible of much cultivation, and the south-west side of the island is as arid and barren as the worst parts of Arabia. The climate is cool and temperate; the island has been famous from the earliest period for the production of the *aloe spicata*, which appears to thrive only in parched and otherwise barren places. The hills on the west side are thickly covered with the plant to the extent of miles, but very little attention is paid to the cultivation and preparation of the aloe for exportation. Next in importance is dragon's blood, which is collected at all seasons; there are also tamarinds, figs, dates, and other fruits; but agriculture is almost unknown, the only grain cultivated being a kind of millet, which requires little attention. The inhabitants depend principally on their date-trees and their flocks. The only animals seen by the British settlers were camels, sheep, goats, asses, beeves, and civet cats. Socotra is inhabited by two distinct races of people; the one called Bedwins, inhabit the mountains, and the high western parts of the island; the other, who call themselves Arabs, are a mongrel race, the descendants of Arabs, Africans, Portuguese, and others. But they all wear the same dress, and have adopted the same language and customs. They are all Mahometans; and there is not throughout the island a single constituted authority. But though without chiefs or laws, good order is pretty well preserved.—(*Memoir on the Island of Socotra, by Lieut. Wellsted, Journal R. Geog. Soc. Lond.* V.)

THE CAPE VERDE ISLANDS are a numerous group in the Atlantic Ocean off the west coast of Africa, about 80 miles from Cape Verde, between 14° and 18° N. lat., and 22° and 26° west long. The principal are *Santiago*, *Mayo*, *Fogo*, *Brava*, *Boavista*, *Sal*, *Santo Nicolao*, *Raza*, *Branca*, *Santa Luzia*, *Santo Vicente*, and *Sant' Antonio*. They are all of volcanic origin, and Fogo still emits much smoke from a crater 7884 feet above the level of the sea. In general the surface of them all is rugged, rocky, arid, and unproductive. The chief article of produce is cotton; there is also a very fine breed of asses and mules, many of which are sent to the West Indies. Goats, poultry, and turtle abound. Salt is formed in large quantities by natural evaporation, particularly in Mayo. The islands belong to the Crown of Portugal, and their governor-general resides at *Porto Praya*, in Santiago. *Tarrafal* or *Terafal Bay*, at the south-west part of Sant' Antonio, is the most convenient watering-place connected with the islands.

FERNANDO-PO, PRINCIPE, SAN THOME, and ANNOBON, are situate in the Gulf of Guinea, directly south of the delta of the Kawara. *Fernando-Po* was discovered by a Portuguese of that name in 1471; it is of an oblong form, 120 miles in circumference, and very mountainous; Clarence Peak, near the northern extremity, rises to 10,655 feet. The mountains and valleys are covered with dense forests of large and valuable timber; but the climate is so unhealthy that it has been abandoned by the British settlement recently formed upon it. It is, nevertheless, still inhabited by a lawless race composed of slaves or malefactors from the neighbouring coast, which is only 20 miles distant. *Principe* or *Prince's Island*, 9½ miles long by 6 broad, is high and wooded. *St. Thomas* is large and fertile; but one half of the island is mountainous, and towards its southern extremity it presents a mass of steep elevations, with abrupt craggy faces, and several pinnacles rising like gigantic ninepins. St. Thomas lies immediately under the equator. *Annobon* is a pretty little island, inhabited by a simple native race; is about 4 miles long, by 2 broad, and rises to an elevation of 3000 feet. The last three islands are nominally subject to the Crown of Portugal.

ST. HELENA is situate in the Atlantic, 1200 miles from the nearest coast of Africa, in S. lat. 15° 15′, and W. long. 5° 49′. It presents to the sea, throughout its circumference of 28 miles, a perpendicular wall of rock from 600 to 1200 feet high. On the summit is a fertile plain, interspersed with conical eminences and fertile valleys. The climate is agreeable and temperate, though moist. There are only four places of access from the sea; and at the largest of these is *Jamestown*, the capital, on the north-west or leeward side of the island. Besides the indigenous plants, coffee, banyans, bamboos, aloes, apples, peaches, mulberries, have been introduced, and are found to thrive. Indeed nearly all the various kinds of tropical and European fruits ripen, more particularly in the sheltered valleys. Vines, oranges, citrons, lemons, figs, pomegranates, mulberries, tamarinds, mangoes, cocoa-nuts, sugar-cane, and pine-apples, thrive well; apples have succeeded tolerably; but the climate seems not congenial to cherries, currants, and gooseberries. Corn and pulse are little cultivated; nor is the climate suitable for them, on account of droughts. Population about 5000. The island was discovered on St. Helena's day (21st May), 1502, by Juan de Nova Castella, the Portuguese admiral, on his return from India; it was long in possession of the English East-India Company, but has now been transferred to the Crown. It has acquired great celebrity from being the place of confinement selected for Napoleon Buonaparte, who lived in it from 1815 to 1820, and was buried in one of its valleys till 1840, when his remains were transferred to Paris.

ASCENSION is a small island of volcanic origin, and of the most arid aspect, in the Atlantic Ocean, in 7° 57′ S. lat., 14° 28′ W. long. It has been recently garrisoned by a small body of British troops, and fortified at every accessible point, to serve as a place of refreshment for vessels employed on the coast of Africa. The shores abound with large turtles; and numbers of these animals are now kept in ponds, from which they can be purchased at 50s. a piece, weighing from 200 to 800 lbs.

The ISLANDS OF TRISTAN DA CUNHA, a small group, in 37° S. lat., 13° W. long., are three in number, rising like hills abruptly from the water to a great elevation. The principal island rises at an angle of about 45° to the height of 3000 feet, above which rises a dome-shaped summit to the height of 6400 feet, bearing the crater of an extinct volcano. The others are named *Inaccessible* and *Nightingale Islands*. They were discovered in 1506 by Tristao da Cunha, a Portuguese, whose name they bear, but remained uninhabited till the present century, when some British or Americans squatted upon them, and make a livelihood by cultivating the soil, and furnishing supplies to the few ships which visit them.

Bissagos or *Bijougas*, a group of small volcanic islands, off the mouth of the Rio-Grande, on the coast of Senegambia, between 10° and 12° N. lat. The inhabitants are said to be brave, but treacherous; they raise some maize, but are chiefly dependent on their cattle, goats, and fishing.

Sherboro, a large island on the coast south of Sierra Leone; off its most westerly point are the *Turtle Islands*.

CANARY ISLANDS.—See page 551.

MADEIRA, PORTO SANTO, and DESERTAS.—See page 556.

ASTRONOMICAL POSITION.—Between 35° and 170° W. longitud
56° S. latitude.

DIMENSIONS. — The greatest length from Point Beechey, on the
curve line, drawn along the Rocky Mountains and the Cordilleras
Cape Horn, is about 10,875 miles; the greatest breadth of North A
fifty-first parallel, is about 3250 miles; and of South America
Roque in Brazil, to Cape Blanco, in Peru, 3200 miles. The nar
the continent, is the Isthmus of Darien or Panama, which connects
America, between the Caribbean Sea and the Gulf of Panama in
the breadth of which, at one place, opposite Mandingo Bay, is lit
miles. The continent is divided by this isthmus into two large
very unequal dimensions, but very different in form: North Amer
7,400,000 square miles; South America, about 6,500,000; and the
other islands along the coasts about 150,000; or, altogether, the c
14,050,000 square miles. In these dimensions we have not includ
the Arctic Islands; of which we shall give a separate account.

BOUNDARIES.—*Northern*:—the Arctic Polar Ocean. *Eastern* an
—the Atlantic Ocean. *Western* and *South-Western*:—the Pacifi
America terminates with a point in the Southern or Antarctic Oce

GENERAL ASPECT.—According to the geographical system ad
world, America ought to be considered as two distinct continents,
isthmus of Darien. Between these there is a striking resemblance
in the north, and gradually contract as they advance towards the so
the one in a narrow isthmus, the other in a narrow promontory.
chain of mountains near its western coast, abounding in volcanoes,
on the opposite side, destitute of any trace of volcanic agency; and
central plain which declines to the south and the north, and is wate
tic streams. In their climate, however, and in their vegetation and an
the two regions are very dissimilar. South America is a peninsul
form; its greatest length from north to south is 4550 miles, and its
from east to west is 3200; its superficial area contains about 6,500,00
which about three-fourths lie between the tropics, and the remainde
temperate zone. From the configuration of its surface this peninsul
into five distinct physical regions: — 1. The low country skirting
Pacific Ocean, from 50 to 150 miles in breadth, and 4000 in length,
extremities are fertile, and the middle portion is a sandy desert. 2.

and afford shelter to a few wild animals of other species. 5. The high country of Brazil, eastward of the Parana and the Araguay, which presents alternate ridges and valleys, thickly covered with wood on the side next the Atlantic, and opening into pasture lands in the interior.

North America may also be divided into five regions:—1. The narrow region which separates the Gulf of Mexico and the Caribbean Sea from the Pacific Ocean, traversed throughout its whole length of 2500 miles by ranges of mountains, which leave a narrow tract of low land along the sea-coasts, while in certain portions of the interior, they form elevated table-lands. 2. The maritime region, between the Pacific Ocean on the west, and the ridge of mountains which extends from Cape St. Lucas in California, northwards to Alashka. 3. The elevated region, which forms a sort of table-land between the Maritime chain above mentioned on the west, and the Rocky Mountains on the east. In its southern portion it presents the arid salt plains of the Californian desert; between 40° and 45° N. lat., it comprises a fertile region, with a mild and humid atmosphere; but, beyond the last mentioned parallel, it is barren and inhospitable. 4. The great central valley of the Missouri and Mississippi, extending from the Rocky Mountains on the west, to the Alleghany or Appalachian mountains on the east, and from the Gulf of Mexico northwards to the 45° or 50° N. lat. Between these parallels runs in a waving line the watershed which divides the basins of the St. Lawrence and the Mississippi, from those of the streams that flow to Hudson's Bay and the Arctic Ocean. On the east side this region is rich and well wooded; in the middle, it is bare, but not unfertile; towards the west, it is dry, sandy, and almost a desert. 5. The eastern declivities of the Alleghany mountains, and the maritime region, extending to the shores of the Atlantic. This is a region of natural forests, and of mixed but rather poor soil. 6. The great northern plain beyond the 50th parallel, four-fifths of which are a bleak and desolate waste, overspread with innumerable lakes, and resembling Siberia in the physical character of its surface and the rigour of its climate.

MOUNTAINS.—The CORDILLERAS DE LOS ANDES skirt the shores of the Pacific Ocean like a vast rampart, along the western coast of South America, from the 12° of N. to the 53° of S. lat., where they reach the Strait of Magellan. Beyond this, the chain is continued along the western and southern coasts of Tierra del Fuego, where it may be said to terminate at the Strait of Le Maire or Staten Island. The Andes derive their name from *anti*, a Peruvian word, signifying copper. Though often described as a single chain, they generally consist of a succession of ridges, separated by high and narrow valleys; but, instead of running in parallel lines, these ridges generally ramify from central points in all directions, and thus present the appearance of a confused assemblage of small chains. Between lat. 33° and 6° S. they spread out to a breadth of 300 miles, and even much farther, if we include the subordinate chains. In the intervals between the ridges are situate many lakes. From 6° S. to 2° N. the Andes contract their breadth, and form an elevated plateau; one part of which constitutes the *paramo* or desert of Assuay, a plain at the height of 13,000 feet above the level of the sea, and presenting a surface of 50 English square miles, where snow storms are frequent, and only a few alpine plants grow. Farther north is another range of table-land, from 9000 to 9400 feet in height, near the northern extremity of which is the city of Quito. On this elevated plain are two lines of lofty summits, which stand detached, and are covered with perpetual snow, bearing the celebrated names of *Chimborazo, Antisana, Pichincha*, &c. From Quito, a single chain extends to Popayan, where it divides into three branches. The western branch, which scarcely reaches an elevation of 5000 feet, separates the valley of the river Cauca from the Pacific Ocean; while a branch proceeding from it passes onward to the isthmus of Panama, where it terminates. The second, or central branch, maintains nearly the general elevation of the main trunk, and has summits which rise into the regions of perpetual snow. It separates the valley of the Cauca from that of the Magdalena. The third, or eastern branch, separates the valley of the Magdalena from the plains of the Rio Meta, and has its northern termination at Cape Vela, in 72° W. long. This, though lower than the central chain, contains summits which reach an elevation of 14,000 feet. Between the central and eastern ranges is situate the plain of Bogota, which is about 8700 feet above the level of the sea; from the perfect level of its surface, and the barrier of rocks that enclose it, this plain appears to have been anciently a lake. The waters of the plain escape by a narrow outlet, and rushing down a cleft, leap at two bounds to a depth of 573 feet, forming the celebrated fall of *Tequendama*, which, in respect of beauty and sublimity, is said not to be surpassed in the world. The mean height of the Andes in Peru, or that of the continuous ridge, independent of projecting cones, is estimated by Humboldt at 11,000 or 12,000 feet; in Chili, according to Mr. Miers, the highest summits, in 33° S. lat., only reach the height of 15,000 feet, while the mean height of the chain is in some places so low as 8000; in Patagonia the elevation is still less, and may be estimated at about 5000 or 6000; none of the summits, so far as is known, exceed 9000. Till lately, the loftiest summits were supposed to be those in Quito; but Mr. Pentland has ascertained that these are greatly surpassed by the mountains of Upper Peru, where the Andes form two cordilleras, or chains, separated by a large table-land, part of which is occupied by the lake Titicaca. The eastern cordillera presents, between 14° and 17° S. lat., a range of snow-capt peaks exceeding 20,000 feet in elevation; and among these are particularly distinguished the *Nevado de Sorata*, 15° 30′ S. and the *Nevado d' Illimani*, a little farther south. The western chain is lower than the eastern, but one of its summits reaches 18,800 feet. The mineral wealth of the region has attracted a large population to this table-land, which, with the exception of Thibet, is probably the highest inhabited country in the world. It was the primitive seat of the empire of the Incas, and the centre of Peruvian civilization. In Quito and Upper Peru, the back or crest of the ridge is free from snow, which only rests on isolated summits; and the means of passing from the one side to the other might perhaps be found wherever it is deemed necessary. In Chili, beyond the latitude of 30° S., the highest point of the most frequented pass was found by Mr. Miers to be 11,920 feet above the level of the sea; and the courier travels it even in winter. In Peru and Quito many of the passes consist of deep clefts, called *quebradas* (breaks), apparently produced by earthquakes, which are extremely narrow, and sometimes a mile deep. In Patagonia, where the snow line is much lower, the passes must be few; but there are some; and this circumstance would of itself authorise the conclu-

sion, that the general elevation of the chain is lower in that country than in Chili. But snowy mountains, and even glaciers, are said to be frequent.

Three branches or transverse chains proceed from the Andes, nearly at right angles, and cross eastward across the continent, about 18° S. and 4° and 9° N. lat. The most northerly of these is the "Cordillera of the Coast," which leaves the main trunk near the southern extremity of the lake of Maracaybo, reaches the sea at Puerto Cabello, and then proceeds eastward through Caracas to the Gulf of Paria, a distance altogether of about 700 miles, with a mean elevation of [illegible]. One of its summits, however, the *Silla de Caracas*, has an elevation of 8400 feet; and its western part, at some distance from the sea, contains the Sierra de Merida, whose elevation is [illegible]. The second transverse chain leaves the main trunk between 3° and 4° N. lat., and, passing eastward, terminates in French Guiana, not far from the mouth of the river Amazon. It is sometimes called the Cordillera of Parimé, but is named by Humboldt the "Cordillera of the cataracts of the Orinoco," because that river, which flows among its ridges in the upper part of its course, forms the falls of Maypure at the point where it descends into the low country. The mean elevation of the chain is estimated at 4000 feet; but only a small part of it has been visited by any European. It separates the basins of the Orinoco and the rivers of Guiana from that of the Amazon, and is covered with magnificent forests. Its breadth is supposed to be from 200 to 300 miles, and its length, about 600 miles. The third transverse chain, which bears various names, and is little known, crosses the continent between 12° and 18° S. lat., connecting the Andes with the mountains of Brazil, and separating the basin of the Amazon from that of the Plata. It is a broad and elevated plateau rather than a distinct cordillera, and consists of low hills or uneven plains, with very little wood, presenting in some places extensive pastures, and, in others, tracts of a poor sandy soil. Its average elevation probably does not exceed 2000 or 3000 feet above the level of the sea.

The *Mountains of Brazil*, which are of moderate height, and occupy a great extent of country, form an irregular plateau, bristled with sharp ridges and peaks. They extend from the shores of the Plata to within a short distance of the Amazon, over a space of 2000 miles, with a breadth of about 100. *Itacolumi*, about 250 miles N. W. of Rio Janeiro, which is celebrated for its auriferous sand and gravel, and contains the sources of three great rivers, the Parana, the San Francisco, and the Tocantin, is considered the most elevated summit, and the nucleus of the whole group. The western ridges of the group, which are near the middle of the continent, are supposed to be lower than those on the coast; but they are probably as high, if Dr. Spix be correct in stating that the mean temperature of the year is below 65°.

	Sierra Tingua, north of Rio Janeiro,	3,549

The *Mountains of North America* form several distinct ridges, the principal of which stretch in the direction of north and south. It has been generally supposed that the isthmus of Panama is traversed by a mountain range connecting the Andes of South America with the mountains of Mexico; but this is not the case. At the eastern extremity of the isthmus, between the mouth of the Rio Atrato and the bay of San Miguel a level plain extends from the one sea to the other, apparently not more yards above the level of either. Here then the mountains of North America commence, but throughout the isthmus they are of small elevation, and the highest point of the road which crosses the ridges, between Panama and the mouth of the river Chagres, has been found to be only 633 feet above the level of the Pacific Ocean. From that point to the table-land of La Puebla, 1400 miles W., no certain information has been obtained respecting the mountains. The most considerable elevations are on the south-west side, and there are no less than 22 volcanoes within that space. From Puebla to Durango the Mexican mountains spread out to form a table-land or elevated plain, from 6000 to 9000 feet above the level of the sea, and from 100 to 300 miles in breadth. Across this plain, in 19° N. lat. are five volcanoes in a line east and west. Two of these, on the eastern side of the continent, with a group of four or five other cones, between Xalapa and Cordoba, have an elevation of more than 17,000 feet, and are the only mountains in Mexico that exceed the line of perpetual snow, which is here about 15,000 feet above the level of the sea. *Jorullo*, the lowest of the five volcanoes, rose suddenly from the midst of a plain, in September 1759. It is 1600 feet above its base, and is surrounded by a number of smaller cones or burning masses, within a compass of four square miles, which have been heaved up in the form of a dome. Near the tropic the Mexican cordillera divides into three branches, one of which runs parallel to the eastern coast, at the distance of 30 or 40 leagues, and terminates in Rio

another proceeds in a north-westerly direction and sinks gradually as it approaches the Gulf ifornia, in the province of Sonora; the third or central chain passes through Durango and New o, separates the sources of the Rio Gila from those of the Rio Bravo, and forms the eastern ridge n trunk of the Rocky Mountains. These, however, are divided from the Mexican chain by a plain, which crosses the country about the 32° N. lat. from California to the Rio Bravo, rising elevation of 4000 feet. From this point the *Rocky Mountains* extend northwards, gradually be- g lower, till at la t their elevation hardly exceeds 2000 feet. They also divide in their northern n into 14 or 15 ridges, separated by narrow valleys, which altogether occupy a breadth of about les, and skirt the Icy Sea at a short distance. From the southern point of California, a lower skirts the coast, as far as the volcano of *Mount St. Elias*, 60° N. lat.; and between this chain and ocky Mountains several intermediate ridges occur, the whole forming apparently an elevated a from 200 to 800 miles in breadth. Many of the summits of the Rocky mountains rise above ow line, and their elevation, where they were crossed by Lewis and Clarke, and also farther has been estimated at 10,000 or 12,000 feet. A shorter route from the valley of the Mississippi west coast has since been found, in the direction of the river Platte, 41° N. lat., where an open- the chain presents a passage so easy of access that a waggon drawn by horses might travel h it.

Alleghany or *Appalachian* Mountains, which form the eastern border of the great central consist of three, four, and, in some places, five parallel chains, extending from south-west to east, from Alabama to New Brunswick, a distance of 1100 miles, with a breadth varying from 150, and a mean elevation of 2000 or 3000 feet. They are almost every where clothed with forests, terspersed with delightful valleys. They present their steepest side to the east, and the transi- om their base to the maritime plain, which skirts the Atlantic, is very distinctly marked by a ledge over which the rivers fall, and to the foot of which, in the northern section, the tide ates. Trenton, Philadelphia, Wilmington, Baltimore, Georgetown, Fredericksburg, Richmond, field on the Neuse, Averysboro on Cape Fear river, Columbia, Augusta, Milledgeville, and Co- a, stand on or near the edge of this ledge, which from the last-named place recedes to the north- hrough Alabama and Mississippi till the Atlantic plain merges into the Mississippi valley. Be- the Alleghanies and the Rocky Mountains the *Ozark Mountains* extend along the middle of the valley of the Mississippi in a northerly and southerly direction. The Arkansas and the Red are the only streams that have forced a passage through these mountains, which, though low, y a great extent of country and are covered with wood.

n Labrador westward a line of elevated ground, not entitled to be called mountainous, as its st known elevation does not exceed 2000 feet, forms the watershed between the basin of the wrence and the great lakes, and the streams which flow northwards to Hudson's Bay. It is, er, cut through by the Nelson river; and, after separating the valleys of the Saskatchawan and urchill, it either sinks down into the great plains of this region or extends north-eastward en Hudson's Bay and the Great Slave Lake.

S, GULFS, AND STRAITS.—1. In the Arctic Ocean:—*Kotzebue Sound, Elson's Bay, Mackenzie's Dease's Inlet, E. Smith's Bay, Harrison's Bay, Liverpool Bay, Franklin Bay, Darnley Bay, George oronation Gulf, Bathurst Inlet, and Melville Sound, Prince Regent Inlet, Fury and Hecla* . 2. On the Atlantic Coast:—*Hudson's Bay*, a large inland sea, between 51° and 64° N. lat., ° and 96° W. long., stretching about 800 miles from N. to S. exclusive of James's Bay, and 600

from E. to W., and containing a surface of about 300,000 square miles. It is navigable only for a few months in the year, being at other times frozen over, or obstructed by drift ice. It is full of sand-banks, islands, and reefs; and its shores are rocky and barren. The southern portion, named *James's Bay*, penetrates southward about 260 miles, with a breadth of 180. On the west coast are *Chesterfield Inlet*, a very narrow channel penetrating westward for 270 miles; *Wager River* and *Repulse Bay*. Hudson's Bay communicates with the Atlantic by *Hudson's Strait*, which is about 500 miles in length, and at the narrowest part more than 80 miles wide. *Cumberland's Strait* and *Frobisher's Strait*, are two partially explored inlets on the west side of Davis' Strait. *Gulf of St. Lawrence*, a large sea inclosed by Newfoundland on the east, Nova Scotia, New Brunswick, and Canada, on the south and west, by Labrador on the north, and communicating with the ocean by the *Strait of Belleisle* to the north, and a nameless strait to the south of Newfoundland. The *Bay of Fundy* separates Nova Scotia from New Brunswick; it is about 180 miles in length by 38 in breadth, and contains an area of 6000 square miles. The shores are high and rocky, and the navigation dangerous, on account of the strength of the tides and the prevailing fogs. The tide sometimes rises 70 feet, and rushes up the bay with incredible velocity. *Passamaquoddy Bay*, between Maine and New Brunswick. *Penobscot Bay* and *Massachusetts Bay*, on the east coast of New England. *Narragansett Bay* in the state of Rhode Island. *Long-Island Sound*, between Long-Island and Connecticut, 120 miles in length, by from 2 to 20 in breadth, and communicating with New York harbour by a narrow strait named *Hell Gates*. *Delaware Bay*, the estuary of the Delaware river, leading up to Philadelphia, is filled with numerous shoals and banks, among which there are several ship channels; it is 16 miles wide at the mouth, but higher up expands to about 30. *Chesapeake Bay*, a noble estuary, between Virginia and Maryland, extending N.-S. about 180 miles, with a breadth varying from 25 to 7. It opens to the Atlantic between Cape Charles and Cape Henry, usually called the Capes of Virginia, which are about 14 miles asunder. The bay is generally deep, contains many commodious harbours, and affords a safe and easy navigation for vessels of the greatest burden. It receives the waters of the large rivers Susquehanna, Potomac, Rappahannock, York, and James. *Albemarle Sound*, an estuary on the coast of North Carolina, about 60 miles in length, and from 4 to 15 wide, communicates with *Pamlico Sound*, a gulf which extends along the coast southward for about 100 miles, with a breadth varying from 8 or 10 to 25; and is separated from the ocean by a series of long and very narrow ridges, or banks of sand. It terminates south-west with the two large estuaries of Pamlico River, and Neuse River, and communicates with the ocean by *Roanoke Inlet*, *New Inlet*, *Ocracock Inlet*, *and Core Sound*, which extends south to *Old Topsail Inlet*. On the outside of the banks is *Raleigh Bay*; and farther south is *Onslow Bay*, likewise separated from the mainland by a series of narrow banks, which form, inside, a long and narrow channel navigable by small vessels. *Long Bay*, between Cape Fear and Georgetown entrance, on the coast of Georgia and South Carolina. *St. Helena Sound*, *Port-Royal Entrance*, *Calibogue Sound*, *Daufuskee Sound*, *Wassaw Sound*, *Ossabaw Sound*, *St. Catharine's Sound*, *Sapelo Sound*, *Doby Inlet*, *Alatamaha Sound*, *St. Simon's Sound*, *St. Andrew's Sound*, and *Cumberland Sound*; on the coast of Georgia. The *Gulf of Mexico* is a large inland sea, about 1100 miles in length from east to west, and about 700 or 800 from north to south, bounded by the coasts of Florida, Alabama, Louisiana, and Texas on the north-east, north, and north-west; by Mexico and Guatemala on the west, south-west, and south; and by Cuba and the channels on each side of it, on the south-east. Along the coasts are the minor bays of *Chatham*, *Galliean*, *St. Charles*, *Carlos* or *Charlotte Harbour*, *Espiritu Santo* or *Tampa*, *Vacassassa*, *Santa Fé*, *Appalachee*, *Apalachicola*, *St. Joseph*, *St. Andrew*, *Choctahatchee*, and *Pensacola*, in Florida; *Mobile* and *Pascagoula*, in Alabama; *Chandeleur*, *Atchafalaya*, *Coto-blanche*, and *Vermilion*, in Louisiana; *Galveston*, *West*, *Espiritu Santo*, in Texas; *Campeché*, between Mexico and Yucatan. This gulf is free from banks, and contains only a few small rocky islands on the coasts of Yucatan, with the Florida reef near its eastern extremity. The shores are low, and generally lined with flat sandy islands, not far from the land. There are few harbours, and the rivers which fall into it are obstructed by bars at their mouths, which render them all, except the Mississippi, nearly inaccessible for vessels of large draught. The currents of the gulf are very remarkable. The water which enters it from the Caribbean Sea is soon divided into two portions, the one running east along the coast of Cuba, the other westward, in a curve line through the middle of the gulf round towards the straits of Florida, where it meets the other current, and the two united form the *Gulf Stream*, which passes with great velocity through the comparatively narrow channel between Cuba and Florida. The gulf is also characterized by the high temperature of its water, which is generally 86°; while in the ocean, in the same latitude, it is only 76° or 78°, and even near the equator is only 80° or 81°. The Gulf Stream flows northward through the *Gulf of Florida* or the *New Bahama Channel*, attaining its greatest velocity at the narrowest part of the strait. The *Caribbean Sea* extends along the northern coast of South and Central America, from the mouths of the Orinoco to the Mosquito shore, being about 1400 miles long, with a breadth varying from 350 to 650. Its northern and eastern boundaries are formed by the long range of the West India Islands, through which it communicates with the ocean by numerous channels. The southern shores are generally high and rocky, and contain several large gulfs. The *Gulf of Paria* separates Trinidad from the continent, and is about 100 miles from E. to W. by about 50 in width. It is shallow, with a muddy bottom, and being always placid, affords safe anchorage for any number of vessels. The *Gulf of Maracaybo* or *Venezuela*, forms a deep and wide inlet, terminating with a navigable strait which communicates with the large *Lake of Maracaybo*; the *Gulf of Darien* extends far inland, on the eastern side of the Isthmus of Panama; *Bluefield's Sound*, on the Mosquito shore; and the *Bay of Honduras*, a large open gulf between the Mosquito shore and Yucatan. The navigation of the Caribbean Sea is clear and open; the islands being neither numerous nor extensive. A current from the ocean enters it through the channels among the Windward Islands, by which its force is broken; and at all seasons a current sets from this sea into the Gulf of Mexico. *Bahia de Todos os Santos*, or *All Saints Bay*, a small round gulf on the east coast of Brazil, forming a noble basin studded with islands, and affording safe anchorage for any number of ships. Lat. 13° S. *Rio de la Plata*, the large estuary of the rivers Parana and Araguay, opens from the Atlantic with a width of 170 miles, and gradually diminishes in breadth till it meets the rivers about 200 miles from the ocean. It is much encumbered by sandbanks, and in the upper part becomes very shallow, so that the navigation is intricate and dangerous. *Bahia de S. Mathias*, *B. de San Joseph*, *Bahia Nueva*, *Bahia de los Camarones*, *Bahia de S. Jorje*, *Puerto Deseado* (Port Desire), and *Bahia Grande*; on the east coast of Patagonia. The *Strait of Magellan*, between Patagonia and Tierra del Fuego, extends from the Atlantic Ocean to the Pacific, for about 300 miles, with a breadth varying from 1½ to 40 miles. Its shores are lofty, and generally rugged, and its depth is in some parts very great. The passage is extremely dangerous, owing to the violent currents, and to the sudden and severe tempests to which the Strait is subject. *Gulf of Trinidad*, *Gulf of Peñas*, *Gulf of Guayaquil*, on the west coast of South America. *Bay of Panama*, which forms the southern side of the great isthmus, is about 130 miles in length with a breadth nearly equal. On its east side is the *Bay of Santo Miguel*, and, on the west, the *Gulf of Parita*. Towards the north-east shore are the *Pearl Islands*, where small quantities of pearls are procured; and in the north-west are a few rocky islands, which form the harbour of Panama. *Gulf of Nicoya*, on the coast, south of the lake of Nicaragua. The *Gulf of California* or the *Vermilion Sea*, extends northward between the mainland of Mexico and the peninsula of California, for about 700 miles, with a breadth varying from 40 miles to 180. Many rocky islands skirt the western shore; and on the eastern is the large island of Tiburon. Pearls

used to be collected here during the last century, but the quantity has diminished. It receives at its northern extremity the river Colorado. The *Port* or *Bay* of *San Francisco*, on the coast of New Albion, extends inland about 50 miles, with a breadth of 20. It contains many good harbours, and receives the waters of three considerable rivers. *Queen Charlotte's Sound*, a large navigable inlet or strait, between the mainland and the island of Quadra and Vancouver. *Nootka Sound*, a place of some notoriety, on the west or oceanic coast of that island. *Norfolk Sound*, *Cross Sound*, *Admiralty Bay*, *Prince William's Sound*, *Cook's Inlet*, *Bristol Bay*, *Norton Sound*, all on the north-west coast.

CAPES.—*Wolstenholme*, the most westerly, and *Chidley*, the most easterly, point of the south side of Hudson's Straits; *Charles*, the most easterly point of Labrador; *Race*, the most easterly point of Newfoundland; *Canso*, the north-east point of Nova Scotia; *Sambro Head*, near the entrance of Halifax harbour; *Sable*, the south-east point of Nova Scotia; *Cape Ann*, at the northern side, and *Cape Cod*, at the southern side of the mouth of Massachusetts bay; *Montauk Point*, the east end of Long-island; *Sandy Hook*, the south side of the entrance to New York harbour; *Cape May*, at the north side, and *Cape Henlopen*, at the south side of the entrance of the Delaware; *Cape Charles* and *Cape Henry*, or the *Capes of Virginia*, at the entrance of the Chesapeake; *Cape Hatteras*, *Cape Lookout*, and *Cape Fear*, on the coast of North Carolina; *Cape Romain*, on the coast of South Carolina; *Cape Canaveral*, *Cape Florida*, and *Cape Sable*, on the coast of Florida; *Catoche*, the north-east point of Yucatan; *San Antonio*, the most westerly point of Cuba; *Cabo de Cruz*, the most westerly, and *Maysi*, the most easterly point of the south coast of Cuba; *Negril*, the most westerly, and *Morant*, the most easterly point of Jamaica; *Tiburon*, the most westerly, and *Enzano*, the most easterly point of Hayti; *Gracias a Dios*, north-east point of Guatemala, in the Caribbean Sea; *San Roque* and *St. Augustine*, on the north-east coast of Brazil; *Frio*, on the coast of Brazil, north of the Tropic of Cancer; *Santa Maria* and *San Antonio*, at the entrance of the Rio de la Plata; *San Juan*, the most easterly point of Staten island; *Horn*, the most southerly point of Tierra del Fuego; *Tres-montes* cape and peninsula, on the west coast of Patagonia; *Corrientes*, on the west coast of Mexico; *San Lucas*, the most southerly point of the peninsula of California; *Mendocino*, on the coast of New California; *Romanzoff*, *Prince of Wales*, *Lisburne*, and *Icy Cape*, on the east side of Behring's sea and strait; *Point Pelee*, *Point aux Pins* or *Landguard Point*, and *North Foreland* or *Long Point*, on the north shore of Lake Erie.

RIVERS.—America abounds with rivers, some of which are the largest in the world; and the larger rivers are almost all favourably distinguished by the characteristic of being navigable throughout the greater part of their course. We shall describe them under the two heads of *North American Rivers* and *South American Rivers*.

§ 1. *Rivers of North America.*

The MISSISSIPPI has its sources in the brooks which form the small lake Itaska or La Biche, about 47° 10′ N. lat., on a high table-land about 1500 feet above the level of the sea, and 3200 miles from the mouth of the river, following the windings of the stream, but only 1250 in a straight line. Rising in a region of swamps and wild rice lakes, it flows at first through low prairies, and then in a broken course through forests of elm, maple, birch, oak, and ash, till, at the Falls of St. Anthony, 1100 miles from its source, it tumbles over a limestone ridge, with a fall of 17 feet. The river is here 600 yards wide. Below this point it is bounded by limestone bluffs from 100 to 400 feet high, and first begins to exhibit islands, drift wood, and sand bars. Its current is slightly broken by the Rock River and Desmoines Rapids, which, however, present no considerable obstacle to navigation; and 850 miles below the Falls of St. Anthony it receives from the west the great stream of the Missouri. Above the junction, the Mississippi is a clear, placid stream, a mile and a half wide; below, it is turbid, and becomes narrower, deeper, and more rapid. Between the mouth of the Missouri and the sea, a distance of 1220 miles, it receives its principal tributaries:—the *Ohio* from the east, and the *Arkansas* and *Red River* from the west; and, immediately below the mouth of the latter, it gives off in times of flood a portion of its surplus waters by the outlet of the *Atchafalaya*. It is in this lower part of its course that the river often tears away the islands and projecting points, and, in the season of high water, plunges huge masses of the banks with all their trees into its current. In many places it deposits immense heaps of drift wood on its mud bars, which become as dangerous to the navigator as rocks and shoals at sea. Below the Atchafalaya it discharges a portion of its waters by the *Lafourche* and the *Iberville*; but the greater part of its contents flows on in the main channel, which passes through a flat tract, by New Orleans, and reaches the Gulf of Mexico at the end of a long projecting tongue of mud, formed by the deposits of the current. Near the sea it divides into several channels, here called passes, with bars at their mouths, on which are from 12 to 16 feet of water. The water is white and turbid, and tinges the sea to the distance of several leagues. The river begins to rise in the end of February or the early part of March, and continues to increase irregularly till the middle of June, generally overflowing its banks to a considerable extent. Above the Missouri the flooded bottoms are from 5 to 8 miles wide; but below that point, they extend to a width of 40 or 50 miles. Below the mouth of the Ohio, no part of the western bank affords a spot suitable for the site of a large town, or hardly even for a road secure from overflow. On the eastern side there are several points where the hills approach the river, and present good sites for towns; but from Memphis to Vicksburg, a distance of 365 miles, the whole tract consists of low grounds subject to inundation; and below Baton-Rouge, where the line of high land wholly leaves the river, and passes off to the eastward, there is no place where a settlement is practicable beyond the edge of the river border, which is higher than the marshy tract beyond it; and by the construction of artificial embankments, called levées, a few feet in height, is entirely secure from inundation. But the tendency of this embankment is to shut up numerous outlets, by which the superfluous waters formerly escaped, and thus to raise the volume and height of the river, and thereby to increase the danger of overflow. Before the introduction of steam vessels, the river was navigated by keel-boats, which, in going upward, were rowed along the eddies of the stream, or drawn by ropes along shore; and by this tedious process more than three months were consumed in ascending from New Orleans to the Falls of the Ohio, a passage which is now made in ten or twelve days. The first steam-boat was introduced in 1810; there are now upwards of 500 on the river.

The MISSOURI has a much longer course than the Mississipi, its extreme length, from its sources to the Gulf of Mexico, being about 4500 miles. It is navigable to the foot of the great falls, about 3800 miles from the sea, and steam-boats have gone up the stream 2200 miles from its junction with the Mississippi. It rises from the Rocky Mountains; some of its sources are only about a mile from those of the Columbia. Its headwaters have not been thoroughly examined; but, in the earlier part of its course, it has been ascertained to be a foaming torrent, which forces its way out of its mountain barriers through a remarkable chasm of perpendicular rocks, nearly 6 miles in length, and 1200 feet in height, called the Gates of the Rocky Mountains. Sixty miles below the last mountain ridge it forms a succession of falls and rapids, inferior in grandeur only to those of Niagara. In a course of 17 miles the river has a descent of 360 feet; and in that space, besides the Great Fall of 90 feet perpendicular and 300 yards wide, and a fine fall of 50 feet, there are several others of from 12 to 20 feet. The Missouri now flows through vast prairies, and, soon after receiving the *Yellowstone* s, large

navigable stream, takes a south and south-east course to the Mississippi. A slight cause might have turned its current towards Hudson's Bay; for the Souris or Mouse River, a branch of the Assiniboine, rises within a mile of its bed, near the point where it begins to take its southerly course. Its principal tributaries are from the west; the *Platte*, a wide shallow stream, the *Kansas*, and the *Ilaya*, are the principal. The Missouri not only has a longer course than the Mississippi, but it brings down a greater volume of water, and imparts its own turbid character to the united stream; yet it loses its name at the confluence. It has an average velocity of 5 miles an hour when in flood, and of 4 or 3 when lower, while that of the Mississippi is only about 3. The obstructions to the navigation of the Missouri are of the same kind as those of the Lower Mississippi, but they are much more numerous and formidable. The channel is rendered intricate by the great number of islands and sand-bars, and in many places the navigation is hazardous from the rafts, snags, falling banks, &c. It begins to rise early in March, and continues to swell till the middle or the end of July, when the summer floods of its most distant tributaries come down. During this period there is sufficient depth for steamers of almost any draught; but during the rest of the year, the river is scarcely navigable through any great distance by boats drawing more than two feet and a-half.

The OHIO (*La Belle Riviere* of the early French settlers) is, next to the Missouri, the most important tributary of the Mississippi. The *Alleghany*, which rises near the edge of Lake Erie, and the *Monongahela*, which issues from the mountains of Virginia, unite at Pittsburg, and take the name of *Ohio*. From Pittsburg the Ohio has a course of 950 miles to the Mississippi, receiving in its progress numerous navigable streams on both sides: from the north, the *Big-Beaver*, *Muskingum*, *Scioto*, *Miami*, and *Wabash*; and from the south, the *Kanhawa*, *Big-Sandy*, *Kentucky*, *Green*, *Cumberland*, and *Tennessee*. The whole region drained by this fine river includes an area of 200,000 square miles, rich in the most useful natural productions, and enjoying a mild and healthful climate. From Pittsburg to its mouth, the Ohio has a descent of 400 feet, or 5 inches to a mile; its current is gentle, and is nowhere broken except by the rapids at Louisville, which do not obstruct the navigation at high-water. The breadth of the stream varies from 400 yards to 1400. The annual range between high-water and low-water is about 50 feet, but sometimes exceeds even that variation. In August, September, and October, the water is at the lowest; in December, March, May, and June, at the highest. The navigation is usually impeded by ice in winter, and, in the upper part of the river, by drought in summer; but during the greater part of the year the stream is covered with all sorts of river craft and steamers, carrying on an active trade.

The ARKANSAS exceeds the Ohio in size; but a considerable part of its course lies through barren, sandy tracts, and in its navigable qualities it is far inferior to the other. In the dry season the river is shallow, and in some places wholly disappears, or leaves only stagnant pools, separated by sand-banks; even its floods are so uncertain, and their rise and fall so rapid, that the stream is nearly useless for navigation. Steam-boats ascend, but with difficulty, to Fort Gibson, only 420 miles from the Mississippi; though the whole length of the river is estimated at 2500 miles.

The RED RIVER rises in the Rocky Mountains, within the Mexican territory, and, flowing eastward, joins the Mississippi in Louisiana. It is navigable for 1200 miles; but its channel was formerly so much choked up by accumulated masses of drift wood, through a distance of 160 miles, in Louisiana, that the greater part of the water was forced out of the bed of the river into numerous bayous or lakes. This obstruction has been lately removed, at an expense to the United States of 300,000 dollars, and steam boats can now ascend the stream throughout the whole of its navigable course.

The ILLINOIS is formed in the north-eastern part of the State of the same name, by the junction of two large streams, the *Kankakee* from Indiana, and the *Des-Plaines* from Wisconsin, from which it flows in a south-westerly course of 300 miles to the Mississippi. It is navigated for 260 miles to the rapids at Ottawa; when swollen by rain it overflows its banks, and the Mississippi, when full, sets back its waters to a distance of 70 miles from its mouth. In some places the river expands to such a width as to have the appearance of a lake; and one expanse of this kind, 20 miles in length, has received the name of *Lake Peoria*. The Kankakee rises in Indiana, within about two miles of the river St. Joseph, which falls into Lake Michigan; and in the wet season, boats may pass from the one river to the other. The Des-Plaines runs for some distance parallel to the shores of Lake Michigan, and not more than 10 miles from the lake, with which there is a natural communication through the Chicago, which is often passed by loaded boats during the spring floods.

The names and length of the principal rivers of the Mississippi basin are stated in the following Table:—

	Miles.		*Miles.*
MISSISSIPPI,	3,200	Salt,	250
Missouri,	3,300	Maramec,	200
Yellowstone,	1,000	St. Francis,	450
Little Missouri,	300	White,	600
Shienne,	300	Arkansas,	2,500
Quicourt,	500	*Canadian*,	1,000
Platte,	1,200	*Neosho*,	800
Kansas,	800	Red River,	2,000
Osage,	500	*Washita*,	800
Gasconade,	300	Ohio,	1,250
Jacques,	600	*Alleghany*,	320
Sioux,	500	*Monongahela*,	300
Grand,	500	*Kanawha*,	450
Charlton,	200	*Kentucky*,	260
St. Peter's,	500	*Green*,	300
Penaca, or Turkey,	200	*Cumberland*,	600
Iowa,	350	*Tennessee*,	1,500
Chacaguar,	200	*Muskingum*,	200
Des-moines,	600	*Scioto*,	200
St. Croix,	300	*Miami*,	173
Chippewa,	300	*Wabash*,	550
Wisconsin,	600	*White River*,	260
Rock River,	450	Hatchy,	200
Illinois,	500	Yazoo,	200
Kaskaskia,	300	Big Black,	200

The ST. LAWRENCE flows from the N. E. extremity of the Lake Ontario, where its stream, for the first forty miles, is divided by a multitude of islets, some consisting of bare rocks, some covered with pine groves, and some presenting smiling meadows. This space is called the *Lake of the Thousand Isles*; but the real number of islands is said to be 1692. About 110 miles from Lake Ontario, a series of rapids interrupts the navigation, but they are now passed by the Cornwall Canal; and below the Lake St. Francis are the *Cedar Rapids* and the *Cascades*, difficulties which are avoided by a short cut called the Military Canal. Below this, the river meets its principal tributary, the *Ottawa*, and the two rivers together form three islands, named Montreal, Jesus, and Perrot. Between Montreal and the southern shore is the beautiful but rapid and dangerous *Sault St. Louis*, which is passed by means

of the La Chine Canal. From this point there is no considerable obstruction to the navigation, but the current of the river is in some places still rapid. Nearly midway between Montreal and Quebec the river forms a wide expanse named *Lake St. Peter;* but further down the width continues pretty regular, till it passes Quebec, below which it encircles the Isle of Orleans, and then gradually and regularly expands into a wide estuary, which may be considered as terminating with the island of Anticosti, about 700 miles from Lake Ontario. At Quebec the width of the river is only 1314 yards; at the mouth of the river Saguenay, 120 miles further down, it is 18 miles wide; at Cap de Monts, or Mont Pelee, 130 miles below, it is 25 miles; and where at last it opens into the gulf, the estuary is nearly 105 miles across. The tide is perceptible at Trois Rivieres, 430 miles above Anticosti. The water becomes brackish 21 miles below Quebec, and is quite salt at Kamouraska, 75 miles lower down. Vessels of 600 or 700 tons reach Montreal, which is 580 miles from Anticosti, with little difficulty, as there is, during this distance, only one rapid, named Richelieu, 25 miles below Trois Rivieres. The river is here so contracted and obstructed by rocks as to leave only a narrow ship channel, in which, at ebb tide, a rapid is formed that cannot be passed without great care; but at high tide, when the water rises 15 or 18 feet, the rapid disappears. Between Lake Ontario and Montreal, the river bears the name of *Kataraqui*, or *Cataraguay*. Below Quebec the St. Lawrence is never frozen over, but the navigation is impeded in spring by the large masses of ice which are floated down from the upper districts, and kept in motion by the combined action of the current and the tides, presenting a most remarkable and almost terrific scene. The channel does not become clear till about the second week of May, and vessels attempting a passage sooner are often wrecked, or crushed to pieces by the floating masses. The principal tributary is the *Ottawa*, which flows from Lake Temiscaming, and much resembles the St. Lawrence itself in its great breadth and lake-like expanses. At its confluence with the St. Lawrence it spreads out into the Lake of the Two Mountains; and 30 miles up its stream are the Long Sault Rapids, which are passed by means of the Grenville Canal. Steamers ascend to Bytown and Hull at the foot of the Chaudieres or Kettle Falls, the principal of which is 60 feet high. Above these there are numerous rapids. The other principal affluents on the left bank are: the *St. Maurice*, at Three Rivers; the *Batiscan*, the *St. Anne*, the *Jacques Cartier*, and the *Saguenay*, a large and broad river, the outlet of Lake St. John. On the right bank: the *Oswegatchie*, *La Grasse*, *Raquette*, and *St. Regis*, from New York; the *Chateauguay*, above Montreal; the *Richelieu*, the outlet of Lake Champlain; the *Yamaska*, *St. Francis*, and *Nicolet*, at Lake St. Peter; the *Besancour*, *Gentilly*, *Du Chene*, *Chaudiere*, and *Etchemin*, between St. Peter's and Quebec.

The RIVER ST. JOHN flows through the disputed territory to the north of the State of Maine, and the province of New Brunswick, into the Bay of Fundy. It has a fall of 75 feet just after entering New Brunswick, and is navigable to that point by flat-bottomed boats, though the lower part of its course contains several rapids. Vessels of 50 tons go up to Fredericton. The *Miramichi* rises near the St. John, and, interlocking with some of its tributaries, affords a good navigable channel almost across the country.

The ST. CROIX, the outlet of the Grand, Umquemengag, and Schoodie lakes, forms the boundary between New Brunswick and Maine, and falls into Passamaquoddy Bay.

The PENOBSCOT collects its waters from the northern part of the State of Maine, and has a course of about 300 miles into Penobscot Bay. It is navigable for the largest vessels to Bangor, 60 miles from the sea; above which point there is a fall of 60 feet; and the navigation even of the lower portion is closed for four or five months in the year by ice.

The KENNEBEC is the outlet of Moosehead lake in Maine, and flows south to the Atlantic. Its channel is interrupted by falls, and is navigable only for small vessels 50 miles up to Augusta, where the tide stops. Near its mouth it is joined by the *Androscoggin*, when the united stream takes the name of *Sagadahock*.

The MERRIMACK flows south through the middle of New Hampshire, into the Atlantic, below Newburyport, in Massachusetts. By the aid of short canals boats are able to go up to Concord, the capital of the state.

The CONNECTICUT rises in the north-east corner of New Hampshire, forms the boundary between that state and Vermont, and flows across Massachusetts and Connecticut into the eastern part of Long-island Sound. There is a sand-bar at its mouth which impedes navigation; but notwithstanding vessels of 10 feet draft go up to Middletown; those of 8 feet, to Hartford, 50 miles from the sea; and smaller vessels proceed 14 miles farther to the head of the tide at Warehouse-point, at the foot of Enfield Falls. Above Enfield, the river has two other falls, at South Hadley and Montague, but is navigated by steam-vessels of light draft, which pass the falls by short canals. Higher up it is rendered navigable for boats to Bath, in North Hampshire, by means of locks and canals. Length of its course, 400 miles.

The HUDSON, which rises in a marshy tract south-west of Lake Champlain, and has a southern course of 325 miles to New York Bay, is the only river of the Atlantic slope whose navigation is not terminated by its passage through the Appalachian mountains. Its head waters rise at an elevation of 4000 feet; but the bed of the river, in the lower part of its course, lies deep below the surface of the adjacent country, admitting the tide 160 miles up to Troy. It is navigable by sloops to Troy, and by ships to Hudson, which is only 30 miles lower down. Between 28 and 36 miles above New York, the Hudson forms an expanse like a lake, named the Tappan Sea, which varies in width from 2 to 5 miles; and, for 20 miles farther down, the channel is bordered on its western side by a range of perpendicular cliffs, which rise from 100 to 500 feet above the water, and are named the Pallisades. The picturesque beauty of its banks, and the legendary and historical interests associated with numerous spots, combine to render the Hudson the classic stream of the United States. The *Mohawk*, its principal tributary, is a turbulent stream, which, in a course of 150 miles, falls more than 430 feet.

The DELAWARE rises in the Catskill mountains, in New York, is formed by two main branches, and flows southwards into the Atlantic, where it forms a wide estuary, below Philadelphia, near which it is joined by its principal tributary, the *Schuylkill*. It is navigable downwards by rafts and arks nearly from its source; but at Trenton the navigation upward is stopped by a great fall, below which it meets the tide 140 miles from the sea. Sloops ascend to this point, and the largest ships reach Philadelphia, 35 miles below. The Schuylkill is navigable 6 miles to Philadelphia by ships of 300 tons; but above that the navigation is stopped by its great fall, and higher up by shoals and rapids.

The SUSQUEHANNA is a long and broad, but generally shallow river, with a course of about 500 miles, chiefly through Pennsylvania, into the head of the Chesapeake Bay. Its principal trunk is so much obstructed by bars, and broken by rapids, as to afford comparatively little aid to navigation, without artificial help; but, as there is nowhere any perpendicular fall, rafts and flat boats easily descend to Middletown, during the season of high water; and small steam-boats ply between Wilkesbarre and Owego.

The POTOMAC is formed by two branches, the most northerly of which rises in the great Back Bone mountain, at the west border of Virginia and Maryland, and the southern branch in Pendleton county, a little further south. It has a very crooked course of 400 miles into the Chesapeake, where its mouth is eight miles wide. Seventy miles up, the channel is still three miles wide, and at Alexandria, nearly 100 miles up, it is above one mile. Between Washington and the Chesapeake the depth varies from 18 feet to 120, but is generally about 30 or 40; above Washington it diminishes to 10 or 12. The tide flows to Georgetown, a little above Washington, and to that point the river is navigable for vessels of

moderate burden. Three miles above Georgetown is a series of rapids called the Little Falls; and a few miles higher up are the Great Falls, where the river descends 76 feet in the distance of a mile and a half, making in one place a perpendicular plunge of 15 feet. The Great Falls form one of the grandest scenes in the United States.

The PATUXENT flows through Maryland into the Chesapeake, in a course nearly parallel to that of the Potomac, about midway between it and the western shore of the Chesapeake. It is navigable 40 miles to Nottingham for vessels of 250 tons, and for large boats to Queen Ann, 15 miles farther up. Its mouth forms a wide estuary, 20 miles north of that of the Potomac.

The RAPPAHANNOCK, rising in the Blue ridge, in Virginia, receives the *Rapid-Ann* from the same chain; and, after falling over the primary ledge into the low country at Fredericksburg, where it meets the tide, 100 miles from its mouth, becomes navigable for vessels of 140 tons; larger vessels may go up 60 miles. In the lower part, however, of its course, it is rather an estuary than a river, expanding to a width of five miles before it joins the Chesapeake.

YORK RIVER, formed by the junction of the *Mattapony* and the *Pamunkey*, in Virginia, partakes throughout its whole course, rather of the character of a narrow bay than of an inland stream. At West Point, the place of confluence, 40 miles from the Chesapeake, it is from 2 to 3 miles wide, with 18 or 20 feet depth of water. The Pamunkey and the Matapony are both navigable by schooners about 40 miles from their mouths.

JAMES RIVER rises from the Alleghany mountains in the western part of Virginia, and enters from the Blue ridge over the Irish Falls. After clearing the hills, it descends into the low country at Richmond, by a fall of 70 feet in the distance of eight miles; below Richmond it gradually becomes wider and deeper, and, in the lower part of its course, expands into a long and spacious estuary with sufficient depth for the largest ships. Vessels of 600 tons go up to City Point, 75 miles from the Chesapeake; vessels of 15 feet draught reach Warwick, 30 miles farther up; and, with the exception of a bar, on which there are only 10 feet, there are 13 feet of water from this point to Rocketts in the port of Richmond; above which, the depth is only six feet. The tide flows to Richmond. It is excluded from the Chesapeake. Within the mouth of the estuary are *Hampton Roads*, a secure and spacious anchorage, sufficiently deep for the largest ships; and, connected with it, is the broad bay called *Elizabeth River*, which forms a capacious inner harbour.

Cape Fear or *Clarendon river*; *Chowan* or *Roanoke*; *Tar*, *Taw* or *Pamlico*, and *Neuse*, are all in North Carolina; but they, as well as all the other streams of that state, have short courses and shallow streams, though, by artificial means, some of them have been made navigable to some distance inland. Nearly the same character will apply to the numerous rivers of South Carolina and Georgia, the principal of which we shall therefore merely name, in their order, proceeding southward, viz. *Waccamaw*, *Pedee*, *Great Pedee*, *Lynche's river*, and *Black river*, all of which have a common estuary in *Winyaw Bay*, which opens to the Atlantic by *Georgetown Inlet*; the *Santee*; the *Cooper* and the *Ashley*, whose common estuary forms the harbour of Charlestown; *Ponpon* or *Edisto*; *Combahee*; *Coosaw*; *Broad river*; *Savannah*, navigable for steam-boats of 150 tons burden, for 250 miles from the sea; the *Ogeechee* and *Canoochee*, which fall into *Ossaba Sound*; *Alatamaha*; *Turtle*; *Satilla*; *St. Illa's*; *St. Mary's*; all in Florida, *St. John's*. The last is a somewhat important stream. It flows northward through the middle of Northern Florida, expanding at last a wide estuary from two to six miles wide. The bar at its mouth is never passable by vessels of more than 11 feet draught, although within the bar there are 15 feet water for 50 miles up the river. The other principal rivers of Florida are the *Ocilla* or *Ausilla*; *St. Mark's*; *Ocklockonee*; *Apalachicola*, navigable for 100 miles; *Escambia* and *Chocktawhatchee*; all of which flow into the Gulf of Mexico.

The MOBILE, in Alabama, is formed by the junction of the *Alabama* and the *Tombekbee* or *Tombigbee*, 30 miles above Mobile bay, in the Gulf of Mexico. A few miles below the junction it gives off a large branch, called the *Tensaw*, which also receives an arm from the Alabama, and reaches Mobile bay below Blakely. The *Tombigbee* is formed by the confluence of two large streams, the *Tombekbee* from Mississippi, and the *Black Warrior* from the northern part of Alabama. It admits vessels drawing six feet water to St. Stephen's, 93 miles from the bay, and steam boats of moderate burden to Tuscaloosa, on the eastern branch, 300 miles, and to Columbus, in Mississippi, on the western branch. The *Alabama* is formed by the junction of the *Coosa* and the *Tallapoosa*, both of which have their sources in the western part of Georgia. It is navigable to Claiborne, 100 miles from the bay, by the same class of vessels that go up to St. Stephen's, and by the smaller steam-boats for 200 miles above the confluence, along both branches. The rivers of Alabama flow in deep beds and at some places during the spring floods 50 or 60 feet above their low-water level. Their unimproved navigable channels is much diminished by the excessive winding of their courses; and during six or eight months of the year the navigation is impeded, and for part of that period suspended, by the shoals and bars, which become impassable at low water.

The PEARL RIVER, in Mississippi, rises in the centre of the state, and flows through a populous and fertile region into the Rigolets or outlet of Lake Pontchartrain. Its mouth is obstructed by sand banks, besides which there are numerous shoals in the river; but steam-boats have ascended to Jackson, a distance of 200 miles, at high water.

The SABINE RIVER flows into the Gulf of Mexico, forming the boundary between Louisiana and the new republic of Texas. It is navigable about 300 miles upward, but its mouth is obstructed by a bar. Near its mouth it expands into a large lake, which is nearly filled up with oyster banks, and which also receives the waters of the *Rio Neches* from Texas, which is navigable for 100 miles.

The *Trinidad* and *San Jacinto* both fall into *Galveston Bay*, which forms their estuary; it is 30 miles where deep, and is crossed by bars with only five feet water in the highest tides. The main channel, however, through the outer bar, has a depth of 13 feet, and within it, contains a secure anchoring ground in five fathoms. The *Rio Bernard de Dios* (God's arm) rises on the north-west border of Texas and reaches the gulf, after a winding course of 600 miles. The *Rio Colorado* is little inferior to the Brazos, but is at present choked up by a jam of drift-wood about 80 miles from its mouth. The *San Bernard*, *La Vaca*, of Matagorda bay; the *Guadalupe*, and the *San Antonio*, which unite before entering the basin of Espiritu Santo, and the *Nueces*, are inferior but navigable streams. The spacious but shallow bays which receive most of the rivers of Texas, and the mouths of those that enter the gulf directly, are barred by shifting sand-banks, through which the channels are often intricate, and seldom have more than 8 or 10, never more than 12 or 13 feet of water.

The RIO BRAVO DEL NORTE, called also the RIO GRANDE or LARGE RIVER, rises from the Sierra Verde in New Mexico, about 40° N. lat., and has a long south-easterly course into the Gulf of Mexico, where it forms the south-western border of the territory claimed by the Texians. It scarcely deserves the name which it bears, as, when compared with the principal rivers of America, it cannot be considered a *great* river. The lower part of its channel is generally only about 200 yards wide, and is so shallow, in many places, that vessels drawing 5 or 6 feet of water cannot ascend more than 100 miles in the ordinary state of the river. Its current is exceedingly rapid, and its banks steep. It is navigable at all seasons for steam-boats drawing 3 or 4 feet of water, as far as Camargo, about 200 miles from its mouth. Its whole course is estimated at 1200 miles.

The *Usumasinta*, a fine river of Central America, rises in the district of Peten in the province of Verapaz, near the source of the Belize, and flows northward to the Bay of Campeche, which it enters to the westward of the Lake of Terminos. Its principal mouth is at the port of Victoria.

The RIO COLORADO falls into the northern extremity of the Gulf of California, after a course of 640 miles; but its sources have not been explored. The depth at its mouth is not more than six feet, and the breadth scarcely exceeds 200 yards. Sixty miles from the sea it is joined by the *Rio Gila*, which rises from the Sierra Mongollon, in the Rocky Mountains, about 34° 20′ N. lat. The country through which these rivers flow is a sandy desert, destitute of good water, and subject to excessive heat.

The OREGON or COLUMBIA RIVER rises in the Rocky Mountains, about 54° N. lat., and has a westerly course of about 1000 miles into the Pacific Ocean, where it forms a wide estuary; but it is infested with breakers, and as the sea rushes over the bar with great violence, the ingress and egress are always difficult. About long. 121° W. it forms a great fall, where it descends in one rapid 57 feet; and soon after passes through a mountain chain, where its width is contracted to 150 yards. The tide at its mouth rises 8½ feet, and ascends the stream 180 miles. Vessels of 300 tons may reach the Multnomah, about 60 miles below the great falls, and sloops go up nearly to the rapids. It abounds with the finest salmon, and with seals, whose skins form a principal article of export from the river.

FRASER RIVER rises from Moose Lake in the Rocky Mountains, and falls into the southern part of Quadra and Vancouver's Sound, or the Strait of Juan de Fuca.

The MACKENZIE RIVER issues from the great Slave Lake, and flows with a broad and majestic stream in a north-westerly direction to the Arctic Ocean. The Mackenzie may indeed be considered as only a continuation of the river *Athabasca* or *La Biche*, which rises at Mount Brown in the Rocky Mountains, between 55° and 56° N. lat., and flows into Lake Athabasca. The *Ungiyah* or *Peace River* also flows from a valley of the Rocky Mountains, partly into the same lake, and partly into the *Slave River*, which issues from it, and carries its surplus waters to the Great Slave Lake.

The *Coppermine River*, discovered by Hearne in 1771, falls into the Arctic Ocean at York Archipelago.

The *Thlew-ee-cho-dezeth* or *Great Fish River* has its source in Lake Sussex, N. lat. 64° 26′, W. long. 108° 20′, and flows to the north-east, falling into a gulf which opens to the Arctic Ocean in N. lat. 66° and W. long. 95°. Its stream is broken by many falls, and forms a number of considerable lakes. This river was first explored by Captain Back, in 1834.

The *Saskatchawan River* flows in two great branches from the Rocky Mountains eastward into Lake Winnipeg, which also receives the *Assinoboin*, *Moose*, *Red*, and *Winnipeg* rivers, from the south; and discharges its surplus waters by the *Nelson*, which enters Hudson's Bay at Fort York. The *Severn* flows from Favourable Lake, and has a course of 250 miles N.E. to Hudson's Bay.

§ 2. *Rivers of South America.*

The MARANON, ORELLANA, or AMAZON, is formed by the union of the *Tunguragua* and the *Ucayle*, 5° 18′ S. lat., 73° 50′ W. long. The Tunguragua issues from the Lake Llauricocha in Peru, within 60 miles of the Pacific Ocean, in 10° 30′ S. lat.; while the Ucayle is formed by the junction of the *Apurimac* and the *Paro*; the former of which has its sources in the mountains to the north-west of Lake Titicaca, and the latter, also named *Rio Beni*, issues from a small lake to the south-east of Titicaca. From the great confluence the Marañon flows, with various windings, in an easterly direction, entering the Atlantic Ocean under the equator, and in 50° W. long. The length of its course from the source of the Apurimac to the sea, including all its windings, may be estimated at 4700 miles. The Marañon is studded with islands, many of which are large; and at its mouth forms, with the Araguay, the large islands of Joanes and Caviana. The mouth of its estuary is about 180 miles wide, and the rise of the tide is felt at Obidos, 400 miles inland. Two days before and after full moon the water rushes into it from the ocean, with prodigious force and noise, in two, three, and sometimes four successive waves, each presenting a perpendicular front of 10 to 15 feet. This great river and its tributaries afford perhaps the greatest extent of inland navigation in the world. The Marañon itself is navigable for 2000 miles in a direct line from the ocean. Its channel is deep, uninterrupted by cataracts or rapids, and may be navigated by ships of any burden up to the confluence of the Tunguragua and Ucayle, where, in March 1836, no bottom was found with 35 fathoms or 210 feet. During the swell in the rainy season, the current is rapid; but at other times it may be stemmed not only by steam vessels, but also by the aid of the east wind, which blows without interruption. The ordinary rate of the current is about 3½ miles an hour when the river is full, but it is less in the dry season. At Jaen, 78° W. long., the bed of the river is only 1240 feet above the level of the sea, so that the fall is less than 6 inches a-mile. The country through which it flows is almost in a state of nature, consisting of boundless savannahs and immense forests, which afford cover and subsistence to innumerable wild beasts and reptiles. During the rainy season a great extent of low country, on both sides of the river, is laid under water; and so vast is the mass of water which it pours into the ocean, that its current has been distinctly felt 300 miles from land. Its mouth was discovered in A. D. 1500, by Vincent Yanez Pinzon, one of the captains who sailed with Columbus on his first voyage; and in 1539 its stream was traced downward from Peru by Francisco Orellana, a Spanish adventurer, by whose name it is sometimes called. The Spaniard has been almost deprived of the honour by his having reported that he had met with armed women on its banks, on which account it received the name of the river of the Amazons, which seems now to be the most generally adopted, though it is a pity that geographers would not agree to drop both Amazon and Marañon, and give the river the more sonorous name of its first explorer, Orellana. Its principal affluents on the right are: the *Yacari*, which is navigable for large boats 200 miles; the *Jutay*; the *Juruá*; the *Teffe*; the *Coary*; the *Purus*; the *Madeira*, a very large river, with a course of 1800 miles, deriving its waters from a wide extent of country between 12° and 20° S. lat., and 58° and 68° W. long.; the *Tapajos*; the *Xingu*; and the *Hanapu*: on the left, the *Napo*; *Putumayo* or *Ica*; the *Japura* or *Jupura*; the united stream of the *Negro* and *Branco*, the former of which communicates with the Orinoco by means of the Casiquari, an affluent of the latter. At its mouth the Amazon communicates by a branch round the south side of the island Joanes, with the *Rio Para*, a stream nearly as large as itself, formed by the junction of that branch with the *Araguay*, a large river which drains the central portion of northern Brasil. From the right the Araguay receives from the same region the large river *Tocantins*.

The RIO DE LA PLATA (Silver River) is merely the estuary of the rivers Parana and Uruguay. The *Parana* has its sources in the north-western slopes of the mountains which skirt the coast of Brazil from Rio Janeiro to the island of St. Francisco; and flowing to the south-west receives, near Corrientes, the great river *Paraguay*, which has its sources on the southern slope of the watershed which separates the basins of the Amazon and the Plata, in the south-west part of Brazil, and collects in its progress southward the waters of many large streams, the principal of which are the *Pilcomayo* and the *Vermejo* or *Rio Grande*, from Upper Peru. From Corrientes the united stream of the Paraguay and the Parana flows southwards into the estuary, receiving from the right the *Rio Salado* (Salt River.) The *Uruguay* rises from the Brazilian mountains, to the westward of St. Catherine's Island, and meets the Parana at the head of their common estuary, the Plata. These streams pour down an immense volume of water, which inundates the low country along their banks from February till May. In the lower course of the Parana the water rises generally 12 feet above the lowest level, and leaves a deposit of grey slimy soil, which is very favourable to vegetation. About 48,000 square miles of

country are said to be subject to these periodical inundations. Before it meets the Uruguay, the Parana divides into numerous branches, forming so many islands; and most of the channels are navigable for boats. The estuary gradually increases from a breadth of 25 miles, till it opens out to the ocean, between Monte Video and Las Piedras, where it is 53 miles wide; the water is generally fresh, and its influence is felt 100 or 120 miles out at sea.

The ORINOCO rises in a mountainous region in the centre of Spanish Guiana, and flows with a very circuitous course through that province into the Atlantic Ocean, which it enters by a great number of mouths opposite the island of Trinidad. The current of the river, in the upper part of its course, is generally very rapid; and even at Angostura, 280 miles from its mouth, it runs with great rapidity, especially at the time of floods, when it is said to flow at the rate of eight miles an hour. The most southerly and widest of its deltaic branches, named the *Boca de Navios*, has a bar of 17 feet water, and the tide ascends to Angostura. In the upper part of its course the Orinoco sends off a branch, the *Cassiquiari*, which has a course of 150 miles, and joins the Rio Negro, an affluent of the Amazon, thus forming a navigable communication between the two great rivers.

The MAGDALENA rises near 2° N. lat. and flows northward through a long valley into the Caribbean Sea, near Santa Marta, after a course of 940 miles. Its principal affluents are the *Rio Cauca* from the left; the *Sogamoso* and the *Canaveralas*, from the right.

The *Rio Atrato* collects the waters of several mountain valleys to the eastward of the isthmus of Panama, and flows northward into the Gulf of Darien.

The *Guarapiche* falls into the Gulf of Paria. Its course is only about 100 miles, but it brings down a great body of water, and is navigable almost to its source.

The *Essequibo*, with its affluents the *Massaroony* and the *Cuyuwini*, the *Berbice*, *Demerara*, *Surinam*, *Marowine* or *Maroni*, and *Corentyn*, all flow into the Atlantic, in Guiana, between the mouths of the Orinoco and the Amazon; but, though generally navigable for some distance inland, they are comparatively unimportant.

The RIO DE SAN FRANCISCO rises from the northern declivity of the Sierra dos Vertentes, about 3000 feet above the level of the sea, near 20° S. lat., and flows in a north-easterly direction into the Atlantic Ocean, in 11° S. lat. It is navigable, without interruption, for about 230 miles from the sea; farther up, though still navigable to a considerable distance, the navigation is much interrupted by rapids and falls. It enters the sea by two mouths of unequal size, of which the northern and larger is about two miles wide; but has so little depth that only vessels of 60 tons burden can enter it at high-water.

In the country to the south-west of the Plata are several rivers, which do not reach the sea. The *Rio Dulce* (fresh water river) rises with several branches in the Andes of Despoblado, and flows in a direction nearly parallel to the course of the Rio Salado, an affluent of the Parana, for about 350 miles into the salt lake *Salagos de los Parangus*. The others are the *Rio Quarto*; the *Rio Quinto*; the *Desaguadero* of Lake Silvero; the *Rio Tunuyan*, named in the lower part of its course *Nuevo*, and after its junction with the *Diamante*, *Rio Salado*, and which terminates in a bitter lake named *Urre-lauquen*, after being joined by the *Chadi-Cubu*. The *Cobu-Leubu* rises from the southern side of the Descabezado peak in Chili, and flows in a south-east direction into the Atlantic, in 39° 50' S lat. The *Cusa-Leubu* or *Rio Negro*, is formed by the union of the *Neuquen* or Rapid River and the *Lemay Leubu* or *Rio de la Encarnacion*, which flows from the lake of *Nahuelhuapi*, in 72° W. long., and 39° S. lat. The united stream flows eastward into the Atlantic, near the north-eastern shore of the gulf of St. Matias. The *Rio de Santa Cruz* flows from the Lake *Capar* or *Viedma*, and after being joined by the *Chalia* and the *Chico*, forms the harbour of Santa Cruz, in the Atlantic Ocean, opposite the Falkland Islands.

The rivers on the west coast having very short courses, are unimportant. The principal of them, proceeding northwards, are: the *Penon*, *San Luis*, *Otomo*, which drains the large lake of Huenauca; *Tolten*, *Cauten* or *Imperial*, *Biobio*, at Concepcion; *Itata*, *Maule*, *Rapel*, *Maypu*, *Aconcagua*, *Quilimari*, *Huantilauque*, *Limari*, *Coquimbo*, *Huasco*, *Copiapo*; all in Chili.

LAKES.—North America is pre-eminently the country of lakes, and exhibits masses of fresh water, unequalled in any other part of the world. The lakes of Canada are the most remarkable as well for their extent as for their utility as channels of navigation; and form just so many large inland seas. *Lake Superior*, measured on a curve line passing through its centre, has a length of 420 miles, an extreme breadth of 165, and a circuit of about 1750, following the windings of the coast. Its surface is 623 feet above the level of the sea; but as its depth varies from 500 to 900 feet, and is even supposed to be in some places 1200 feet, its bottom lies far below the level of the ocean. The area of the lake contains about 40,000 square miles; that of the basin which it drains by means of 220 rivers and brooks, amounts to 140,000. Some of these rivers are considerable streams, and, though the sources of not of them are more than 50 or 70 miles from the lake, yet their winding channels are often double that length. Their sources are in general 500 or 600 feet above the surface of the lake, and their currents are much broken by rapids and falls. There is no regular rise and fall of the waters of the lake, but the continued prevalence of a heavy gale from a particular quarter sometimes raises them several feet, and the surface is perceptibly higher during the spring freshes after a severe winter. The water is very pure and cold; the bottom consists of an adhesive clay. The northern shore consists of lofty rocks, from 300 to 1500 feet high, and is lined with numerous islands which afford shelter for vessels. The southern coast consists chiefly of low, sandy beaches, interrupted by limestone cliffs, and destitute of sheltered bays. The only islands, except those on the coasts, are those of *Michipicoten* or *Maurepas*, and the *Caribou Islands* in the eastern portion, belonging to Britain, and *Isle Royale* in the western part, which belongs to the United States.

LAKE HURON receives the surplus waters of Lake Superior through the river St. Mary, which is about 30 miles in length, with a fall of 50 feet, 22½ of which occur at the Sault or Rapids of St. Mary, extending over a space of two miles. The greatest length of the Lake Huron from the mouth of the St. Mary to the outlet of its waters, is 250 miles; its greatest breadth in the northern part, is 220, but in the southern part it is much less; its circuit is about 1200 miles; its area, 25,000 square miles; its surface, 595 feet above that of the ocean; and its depth about 450 feet. The shores on the west and south-east are low, and little broken, forming long regular curvatures; while in the north-east and north they are high and indented. The long chain of the *Manitoulin islands*, which stretches from the mouth of the St. Mary to within 10 miles of Cabot's head, has the same geological character, and exhibits the same broken appearance as the northern coast. These islands almost completely divide the great expanse called the *Georgian Bay*, from the body of the lake. On the west side of the lake is a large inlet named *Saginaw Bay*.

LAKE MICHIGAN lies on the same level with Lake Huron, and is, indeed, properly a part of it, the two lakes being connected by the *Strait of Michilimackinac* or *Mackinaw*, which is four miles wide at the narrowest part. The form of the lake is elliptical, and in general quite regular, the coasts extending in long uninterrupted sweeps. The length is about 300 miles, the breadth from 80 to 90; the area 25,000 square miles; and the greatest depth about 900 feet. *Green Bay*, on the west side, is nearly detached from the body of the lake by a long peninsula and several islands. The shores are generally low, and their regular conformation almost deprives the lake of natural harbours. The outlet of lake Huron is called the *River of St. Clair*; which, after a course of about 30 miles, expands into a shallow lake of the same name, about 100 miles in circumference. The outlet of this lake is the river *Detroit*,

miles in length, which falls into lake Erie. These two rivers with the intervening lake are navigable for vessels of 7 or 8 feet draught; their banks are low and level.

LAKE ERIE is 265 miles long by 63 in breadth at the middle; its surface is 565 feet above the level of the sea, forming an area of 11,000 square miles; but its depth does not much exceed 100 feet. The shores are low, the northern consisting of sandy beaches and clay banks; and the southern, chiefly of shingle beaches or sand-banks, interrupted by rocky cliffs. Towards the west there are extensive marshes on both sides. The want of sheltered bays on both coasts has rendered it necessary to resort to pier harbours; the mouths of the rivers are also obstructed by sand-bars. The islands, 26 in number, are all in the south-western portion of the lake. The largest are *Pelee*, belonging to Canada, and *Cunningham*, to the United States. The *Bass Islands*, a group of small islands, valuable for the shelter and anchorage which they afford, are within the American limits. The winds are generally up or down the lake, and in summer blow up for two-thirds of the season. Violent and dangerous gales prevail in autumn and winter, and the lake is usually covered with floating ice till May. The river *Niagara*, 33 miles in length, forms the outlet of Lake Erie, and has a descent of 334 feet to Lake Ontario. Of these, 165 form one perpendicular fall, and 51, the descent of the Rapids in the half mile immediately above the falls. Below the falls the Niagara flows through a deep rock-bound chasm, the sides of which are formed by mural precipices, nearly 300 feet high, as far as Queenstown, where the ground sinks down almost to the level of the river. The great fall, 20 miles from Lake Erie, is divided by Goat Island into two portions, one of which, named the Horse-shoe fall, from its semicircular form, has a lineal extent of 600 yards, on the Canadian side; the other, an extent of 300 yards, on the American side. For grandeur and sublimity, the *Falls of Niagara*, are hardly equalled, certainly not surpassed by any other natural scene in the world. President Dwight of Newhaven estimates the quantity of water precipitated over the Falls at 11,299,375 tons an hour; Darby, at 1,672,704,000 cubic feet, per hour; and Picken, at 113,510,000 gallons, or 18,524,000 cubic feet, a minute. The river contains several islands, one of which, named *Grand Isle*, contains 18,000 acres of rich fertile soil covered with forests; and another, *Navy Island*, which acquired some notoriety in the late Canadian insurrection. Grand Isle is on the American, Navy Isle on the Canadian side.

LAKE ONTARIO is about 200 miles in length; its greatest breadth is 60; its circuit, 470; its area, 10,000 square miles; its surface, 231 feet above the level of the sea; its depth from 300 to 600 feet. The shores are generally low; but, between Toronto and the Bay of Quinte they are higher. The lake has but few natural harbours; those of Toronto and Kingston on the north, and Sackett's harbour on the south-east, alone are good. There are about 20 small islands in the eastern part of the lake. Its great depth renders it less liable than Lake Erie to be obstructed by ice. It emits its surplus waters by the river Kataraqui, and the *Lake of the Thousand Islands*, which afterwards become the St. Lawrence.

The other principal lakes of Canada are: *St. John's*, north of Quebec; *Nipissing*, *Missisagua*, *Muskoka*, *Trading*, *Simcoe*, *Cameron's*, *Sturgeon*, *Pigeon*, *Shemong*, *Trout*, *Rice*, *Rideau*, *Mississippi*, in Upper Canada. The British territory to the north-west of Canada, contains a great many other lakes, of which it may be sufficient to mention the names and dimensions of the principal, viz. The *Lake of the Woods*, west of Lake Superior; *Winnipeg*, 280 miles long, breadth varying from 15 to 80; area, 9000 square miles; *Winnepegoos* or Little Winnepeg; *Athabasca*, 3000 square miles; *Great Slave Lake*, 12,000 square miles; *Great Bear Lake*, 8000 square miles; *Wollaston Lake*; *Deer Lake*; *Big Like*; *Abbitibbi* and *Misstassin*, to the south and south-east of James' Bay.

In the United States: *Lake Champlain*, between New York and Vermont, 120 miles in length, from 1 to 15 in breadth; area 500 square miles; 90 feet above the level of the sea. It is deep enough for the largest vessels, but is commonly navigated by ships of 70 or 80 tons, which can get access to the rivers and canals. It contains more than 50 islands, and the aspect of its shores is varied and pleasant. It is connected with the Hudson river by a canal, and discharges its surplus waters by the Richelieu, which flows to the St. Lawrence. *Lake George*, 36 miles long, and from three-quarters of a mile to 4 miles broad, studded with several hundred islands, is remarkable for the purity of its water and the beauty of its scenery, and has an outlet 3 miles long, with a rapid descent of 200 feet down to Lake Champlain. Along the south side of Lake Ontario, within from 20 to 60 miles, are the Lakes *Oneida*, *Otsego*, *Skaneateles*, *Owasca*, *Cayuga*, *Seneca*, *Crooked*, *Canandaigua*, *Honeoaye*, *Hemlock*, and *Canesus*; all in New York. Cayuga and Seneca are the principal, the former being 36 miles in length, and the latter 35; but both very narrow. In the western part of the same state is Lake *Chateauque*, a small but deep and navigable body of water, 1300 feet above the level of the sea. It has been estimated that one-sixth part of the surface of the State of Maine consists of water; and, indeed, the lakes are so numerous as to form one of the characteristic features of the country. Some of them are remarkable for the picturesque beauties of their scenery, and many of them will be useful channels of communication when the neighbourhood becomes more densely inhabited. In the north are the *Temiscouta*, the *Baamchenungamock*, and the *Pongokwahem*; in the centre are *Moosehead Lake*, 50 miles long, but of very irregular breadth, *Chesuncook*, 20 miles long, and *Pemadumcook*. The *Moosetegmaguntic* and the *Umbagog* are on the western frontier, and the *Schoodic* and *Upper Schoodic* on the eastern. In New Hampshire are a great many small lakes; the largest and most important of which is *Winnipiseogee*, a picturesque sheet of water of very irregular form; 22 miles in length, and from 2 to 10 in breadth. About 300 pretty islands are scattered over it, and its shores are indented by beautiful bays, formed by gentle swells of land rising gracefully from the water. The lake abounds in fish; and is navigated by steam vessels. Lake *Memphramagog*, partly in Vermont and partly in Canada, is 40 miles in length by 2 or 3 in width, and surrounded by a tract of fertile level country. Novaculite or oil stone is found on an island of the lake, and sold under the name of Magog oilstone. The lake discharges its waters by the river St. Francis, which falls into the St. Lawrence 40 miles above Quebec. In Louisiana are the great lakes of *Pontchartrain*, *Borgne*, *Ouacha*, *Grand*, and others, formed by the waters of the Mississippi; *Bodeau*, *Cado*, *Bistinoe*, *Cannimia*, *Bayou-Pierre*, *Spanish*, *Black*, and others, formed by the Red River and its branches. In Wisconsin is Lake *Winnebago*, formed by the Fox river, which falls into Green Bay in Lake Michigan; the *Four Lakes*, in Dane county; *Kushkanong*, in Jefferson county, and *Geneva*, in Walworth county; *Red Lake*, near Red River, in the northern part of the territory.

The TULE LAKES, in California, extend in the direction of the coast, from south-east to north-west for about 200 miles; they are said to be fordable at several places, in the dry season; and, during a considerable part of the year, very little, if any, water runs into the bay of St. Francisco, which receives the river that issues from their north-western extremity. The four lakes of *Zumpango*, *Christoval*, *Tezcuco*, and *Chalco*, are small bodies of water in the elevated plain of Mexico; but the largest lake in the country is that of *Chapala*, in the plain of Xalisco, which is traversed by the river Santiago. It is about 90 miles long, and from 12 to 18 wide. *Ilza* lake in Guatemala, about north lat. 16° 8', and west long. 91° 16', is 30 miles long by 6 broad, containing 11 islets, and surrounded with lands fertile in the extreme. *Golfo Dolce*, also in Guatemala, 28 miles long by 12 broad.

The LAKE of NICARAGUA, in Central America, between 10° and 12° N. lat., and 84° and 86° W. long., is 120 miles long, and 40 in breadth. At a little distance from the shore it is from 6 to 20 fathoms deep, and in some places more: it contains several islands, chiefly of volcanic formation; the most remarkable of which is Ometepe, not far from the south-west shore, which contains a lofty volcano. The surface of the lake is 134 feet above the level of the sea. It discharges part of its waters by the river Tepitapa, into the *Lake of Managua*, which is 45 miles long, and 15 wide, and deep enough

for large vessels, but has no outlet. The greater part, however, of the waters of Nicaragua flow to the Caribbean Sea, by the Rio de San Juan, which is about 120 miles in length. Both the lake and the San Juan are navigated by small river barges of about two tons burden.

The LAKE OF MARACAYBO, near the northern coast of South America, is 120 miles in length by 80 in breadth. It receives the waters of nearly 100 rivers, and communicates with the Gulf of Maracaybo by a channel 12 miles long, and 3 miles wide where narrowest. A bar runs across the entrance, with only 10 or 12 feet water. The lake has a considerable depth, except towards the shores; the water is fresh, except during strong northern breezes, when it becomes brackish towards the northern end.

The LAKE OF TITICACA, in Upper Peru, occupies the lower portion of an elevated valley, about 13,000 feet above the level of the sea, and extends about 300 miles in length, by from 30 to 60 in width. The lake covers a surface of about 4000 square miles; and from its southern extremity issues a stream called the Rio Desaguadero, which flows south-south-east, with a gentle current along the valley, and is lost in swamps and lakes near 19° S. lat. The surface of the lake, according to Mr. Pentland, is 12,795 feet above the level of the sea.

The Lake of *Xarayes* is only an immense swampy plain, along the river Paraguay, between 15° and 20° S. lat., reaching in some places 100 miles in breadth from the river. It is overflowed for about six months during the rainy season. A considerable portion of it is covered with a kind of wild rice, on which innumerable flocks of water-fowl, especially geese, feed. To the westward are a number of lakes called the *lagunas* in the country of the Chiquitos, which are also supposed to derive their waters from the overflowing of the Paraguay. The lake or lagoon of *Ybera* is a similar swamp, extending in width about 30 leagues parallel to the course of the Parana, to the eastward of Corrientes. Spreading far and wide to the south it occupies an area of about 1000 square miles, and supplies four considerable rivers. Its surface is covered with a prodigious quantity of aquatic plants and shrubs. The celebrated lake of *Parima*, in Guiana, is represented by the small lake of *Amucu*, only about three miles in length, and almost covered with rushes; but expanding, in the rainy season, to an inland sea.

The *Lagunas de Guanacache*, a singular chain of lakes, formed by the confluence of the rivers of Mendoza and San Juan, which form the drains of the eastern side of the Andes, between 58° and 34° S. lat. The Guanacache emits its waters by the river Tres Cruces, which carries them to *Lake Bilcero*, from which they are again carried by the Desaguadero into a vast lake named the *Beredero*, below the town of San Louis, in 34° S. lat. This lake also receives a portion of the waters of the river Tunuyan, the greater part of which, however, now flow by a new channel called the Rio Nuevo into the Rio Diamante. The last named river flows from the Andes, and, after being joined by the Rio Nuevo and the Chadi-Cubu or Salt River, terminates in a great inland lake, without outlet, called the *Urre-lauquen*, or Bitter Lake, from its extreme saltness. This lake is situated about 35° S. lat., and 65° W. long.

GEOLOGY.—The geology of the South American mountains, particularly of the Andes, is distinguished, like their physical form and arrangement, by some remarkable peculiarities. The first and most peculiar feature of this chain is, that it contains at least 30 active volcanoes, irregularly distributed along the line from the one extremity to the other; but chiefly in Chili and Equador. Some of them only emit smoke; others throw out mud and water; only a few produce lava. The second peculiarity in their structure is closely connected with the first: it is the prodigious space occupied by the basalts, porphyries, and trachytes, that is, by rocks of igneous origin. The base of the chain consists of granite, which may be conceived as forming a long elevation of from 5000 to 10,000 feet. Overlying that are beds of gneiss, mica slate, clay slate, and greywacké; but they are seldom all together, and probably in most places rest on the sides of the granite, without covering its summit. Above these, sometimes in beds, but more frequently in amorphous masses rest immense deposits, first, of an old porphyry, next, of a newer porphyry rich in metals, then of basalt, clinkstone, and amygdaloids, with masses of trachyte and syenite interspersed. This order, however, must not be understood as uniform or perfectly determined. These volcanic rocks, which occupy a trifling space in Europe, and never occur at great elevations, form almost every where the summits of the Andes, and exhibit in some places the enormous thickness of 10,000 or 12,000 feet; constituting probably one-third of the bulk of the whole chain. On the flanks of the Andes are found vast beds of sandstone and coal, of limestone containing fossil shells, and of other secondary formations up to the green sand. Shells and coal have been found at the height of 14,000 feet, and gypsum and rock-salt occur at various elevations. The third peculiarity of the chain, is the abundance of its mineral treasures, which include extremely rich veins of gold, silver, copper, and most of the other metals. The Andes are also distinguished by having their sides invested with a thick coat of clay, in which deep gullies have been worn by the streams. The great diffusion of internal fire throughout the chain, the newness of some of the strata, the frequency of earthquakes, and the recent elevation of part of the western margin in Chili, to the height of three or four feet above its former level, have led geologists to infer that the Andes, though surpassing most other mountains in elevation, are among the last which have been raised from the bottom of the ocean.

The transverse chain of the coast of Caraccas consists partly of primitive, and partly of secondary formations. The cordillera of Parimé, so far as hitherto examined, is wholly composed of primitive rocks, as granite, gneiss, mica slate, and hornblende; the cordillera of Chiquito, which separates the basins of the Plata and the Amazon, is only known at its eastern extremity, where it joins the mountains of Brazil. These last consist of a great number of ridges generally running north and south. Granite abounds in those nearest the Atlantic; but the prevailing rock

every where else, as far westward as the mountains of Cujaba, 55° W. long., is a quartzy mica slate, intermixed with granite, gneiss, and quartz rock, with portions of secondary sandstone resting on its sides, or in its valleys. This quartzy mica-slate, in Brazil, is the matrix of the gold and diamonds; the former of which is generally accompanied by platinum and iron. The direction of the strata approaches to north-east and south-west, and the dip, where it has been observed, is from 50° to 70° S.E. These mountains, like the Andes, are in many parts covered with a bed of clay. The rocks of the great plains have been but partially examined. Humboldt thinks that the northern *llanos* of Caraccas are of old red sandstone. Marls and clays, apparently of the tertiary class, were found by Mr. Caldcleugh in the *pampas* of Buenos Ayres; and, since deposits of rock salt exist on the east side of the Andes, it is probable that the whole plain of the Plata is occupied by secondary and tertiary formations.

In North America the Alleghany mountains present their scarp or steepest side to the east, where granite, gneiss, and other primitive rocks are seen. Upon these lie, first, a thin formation of transition rocks dipping to the westward; and, next, a series of secondary rocks, including a very extensive coal formation, which reaches from Pittsburg to far beyond the Mississippi. The Ozark mountains exhibit similar strata in the same order and position; and therefore probably consist of a western portion of the same beds raised to the surface by a slip or dislocation. In the rocky mountains, primitive rocks are found in the centre or axis of the chain, with old red sandstone, coal, and new red sandstone, containing rock salt, leaning against its sides. A great tract to the eastward of this chain is covered by granitic sands, and, near the bed of the Mississipi, there is a deep formation of alluvium. The Mexican table-land consists chiefly of transition slaty rocks, intermixed with which are two species of limestone, and enormous masses of porphyry, trachyte, syenite, phonolite, basalt, volcanic tuff, and other rocks of igneous origin. The veins of silver and gold are found chiefly in the older porphyry, the granular limestone, the syenite, and the transition slates.

TABLE OF THE MINERALOGICAL PRODUCTIONS OF AMERICA.

DIAMONDS.—Brazil, *Minas-Geraes*, &c.

OTHER PRECIOUS STONES.—Brazil, *Minas-Geraes*, &c.; Colombia, *Cundinamarca*; Chili; Peru.

GOLD.—Colombia, *Andageda, Atrato, San Juan, Cauca, Choco*, &c.; Brazil, *Minas-Geraes, Goyaz*, and *Mattogrosso*; Mexico, *Pinieria-alta in Sonora* and *Sinaloa*; Chili; Peru; Bolivia; United States of North America, *Anson County, North Carolina, Davidson County, South Carolina*; Central America.

SILVER.—Mexico, *Guanaruato, San Louis Potosi, Zacatecas*, &c.; Bolivia; Chili; La Plata, *Mendoza*; Central America.

TIN.—Peru; Mexico.

MERCURY.—Peru; Mexico.

COPPER.—Chili; Peru; Mexico; United States, *New York, Indiana*, &c.

LEAD.—United States, *Galena, in Illinois, Washington County, Missouri, New York*, &c.; Mexico.

IRON.—United States, *New Jersey, Pennsylvania, Massachusetts, Connecticut, South Carolina, New York, Maryland*; Mexico; Brazil, *St. Paul, Minas-Geraes*, &c.; Canada, *Mines of St. Maurice*; Colombia; Central America.

COAL.—Cape Breton; Nova Scotia; United States, *Pennsyloania*, &c.; Chili, *Penco*.

SALT.—La Plata; Brazil, *Rio Grande do Norte, Para*, &c.; United States, *Onondaga County, New York, Barnstaple County, Massachusetts, Kentucky, Gallatin County, Illinois, Missouri*, &c.; Central America *Honduras*, &c.; Colombia, *Zipaquira*, &c.; Mexico, *Oaxaca, New California*; Peru; Bolivia, *Yocalla, Chiquitos*; Bahamas, St. Kitts, and others of the Antilles.

CLIMATE. — The latitude of the country and the elevation of the land in both divisions of the continent, its position in reference to the sea, and the direction of the prevailing winds, are the chief circumstances which determine the nature of the climate. We have already stated that three-fourths of South America lie within the tropics, and the remaining fourth in the temperate zone; but, in both of these divisions, it might be naturally inferred, that a huge wall like the Andes, rising into the atmosphere to the height of two or three miles, and stretching across the course of the tropical and extra-tropical winds, would exert a powerful influence on the temperature, humidity, and the distribution of the seasons. This is actually the case; and it is this vast chain of mountains, with its prolongation in North America, which affords a key to the most remarkable peculiarities in the climate of the whole continent. The subject, we think, has not been hitherto well understood, though it admits of being explained in a very simple manner.

The trade-winds, which blow from the east, occupy a zone 60° in breadth, extending from 30° S. to 30° N. lat. Beyond these limits the winds are variable; but the prevailing direction of their course in the open sea, where no accidental causes operate, is well known by navigators to be from the west. Now these winds are the agents which transport the equable temperature of the ocean, and the moisture exhaled from its surface, to the interior of the great continents, where it is precipitated in the form of

rain, dew, or snow. Mountains attract the moisture which floats in the
they obstruct also the aerial current, and, presenting great inequalities of
favour precipitation. Rain, accordingly, in all countries, falls most abund
elevated land. Let us consider, then, what will be the effect of a mural r
Andes in the situation which it occupies. In the region within the 30th
moisture collected by the trade-winds from the Atlantic will be precipit
on the mountains of Brazil, which are but low, and are so distributed as
into the interior. The portion which remains will be borne westward,
little as it proceeds, will be arrested by the Andes, and fall down in sho
summits. The aerial current will now be deprived of all the humidity
separated from it, and will arrive in a state of complete exsiccation at Pe
rain will consequently fall. That even a much lower ridge than the And
cept the whole moisture of the atmosphere, is proved by a well-known
in India, where the Ghauts, a chain only 3000 or 4000 feet high, divide
winter, as it is said; that is, copious rains fall on their windward side,
other the weather remains clear and dry; and the rains regularly chan
west side to the east, and *vice versa*, with the monsoons. In the regio
30th parallel, this effect will be reversed. The Andes will in this ca
screen to intercept the moisture brought by the prevailing west winds fro
Ocean; rains will be copious on their summits, and in Chili on their w
vities, while none will fall on the plains to the eastward, except occasional
winds blow from the Atlantic. The phenomena of the weather correspond
able manner with this hypothesis. On the shores of the Pacific, from C
the 30th parallel, to Amotape, at the 5th of S. lat., no rain falls; and the
is consequently a sandy desert, with the exception of the narrow strips of
the streams that descend from the Andes, where the soil is rendered p
irrigation. From the 30th parallel southward the scene changes. Rains a
vegetation appears on the surface, and becomes more vigorous as we ad
ward. "At Concepcion," says Captain Hall, "the eye was delighted wit
and most luxuriant foliage; at Valparaiso the hills were poorly clad wi
brushwood and a poor attempt at grass, the ground looking starved and n
quimbo the brushwood was gone, with nothing in its place but a vile so
pear bush, and a thin sprinkling of grey wiry grass; at Guasca (lat. 28
not a trace of vegetation, and the hills were covered with bare sand."
from the principle we have laid down, that in this southern part of the c
dry tract should be found on the east side of the mountains, and such
At Mendoza, in lat. 30°, rain scarcely ever falls; and the district along
base of the Andes is known to consist chiefly of parched sands, on which a
shrubs grow, and in which many of the streams that descend from the m
absorbed before they reach the sea. The whole country, indeed, south o
suffers from drought; but on the eastern side this evil is remedied to som
winds from the east or south-east, which bring occasional rains to refresh th
Amotape northward, on the other hand, the west coast is well watered
and this change is easily accounted for. The line of the coast here changes
and trends to the north-east as far as the Isthmus of Panama, where th
sink to a few hundred feet in height, and leave a free passage to the trade-
here often assumes a direction from the north-east, or even the north.
tions of the Atlantic are thus brought in abundance to the coast of Quit
in consequence well watered; while the neighbouring district of Peru
perpetual aridity.

Our principle applies equally to the explanation of some peculiar facts
with the climate of North America. The western coast of Mexico, as far
or Mazatlan, in lat. 23°, is well watered, because *first*, the continent here
secondly, the table-land of Mexico, which is much lower than the Andes
not so effectual a screen to intercept the moisture; and, *thirdly*, there is
believe that a branch of the trade-wind, which crosses the low part of th
at Panama and Nicaragua, sweeps along the west coast during part of the
transports humidity with it. But beyond the point we have mentioned d
vails. Sonora, though visited occasionally by rains, consists of sandy plai
of herbage, where the streams lose themselves in the parched soil witho
the sea; and even Old California, which has the ocean on one side, and a
on the other, and ought apparently to be excessively humid, is covered
rocks and sandy hills, where the vegetation is scanty, and where no timber
cept brushwood. This dry region extends as far as 33° or 34°; but immedia

this we have another change of scene. New California is described as in all respects a contrast to the Old. It is rich, fertile, and humid, abounding in luxuriant forests and fine pastures; and the American possessions to the northward preserve the same character. How can we account for this singular diversity of climate, except on the principle which has been explained, namely, that in all regions where ranges of mountains intersect the course of the constant or predominant winds, the country on the windward side of the mountains will be moist, and that on the leeward dry; and hence parched deserts will generally be found on the west side of countries within the tropics, and on the east side of those beyond them? Our hypothesis applies equally to the country east of the Rocky Mountains. For the space of about 300 miles from the base of this chain, the surface of the country consists of dry sands or gravel, sometimes covered with saline incrustations, nearly destitute of trees and herbage, and watered by streams flowing from the mountains, which are sometimes entirely absorbed by the arid soil. The central and eastern part of the basin of the Mississippi would in all probability have been equally barren had the configuration of the land been a little different in the south. A tract of country extremely low and level extends along both sides of this river; and a portion of the trade-winds, which blow from the Mexican Gulf, finding its motion westward obstructed by the high table-land of the Cordillera, is deflected to the right, and ascends the valley of the Mississippi and Ohio. This wind, whose course was first traced by Volney, bears with it the humidity of the torrid zone, and diffuses fertility over a wide region which would otherwise be the abode of barrenness.

Great misapprehensions have arisen respecting the climate of America, from comparisons being drawn between the east side of the new continent and the west side of the old. We have already pointed out the influence of sea-winds in modifying the state of the atmosphere over the land, both as to heat and humidity. When this circumstance is attended to, and when the east and west sides of the old and the new continents are respectively compared with each other, the difference is found to be small, and easily accounted for. In the torrid zone, and on the sea-shore, the temperature of both continents is found to be the same, viz. 82°; but in the interior the difference is rather in favour of America. There is no counterpart in the new world to the burning heats which are felt in the plains of Arabia and Gedrosia. Even in the western and warmest portion of the parched plains of Caraccas, the hottest known region in America, the temperature of the atmosphere during the day is only 98° in the shade, while it rises to 112° in the sandy deserts which surround the Red Sea. At Calabozzo, farther east in the plains, the usual temperature of the day is only from 88° to 90°; and at sunrise the thermometer sinks to 80°. The basin of the Amazon is shaded with lofty woods; and a cool breeze from the east, a minute branch of the trade-wind, ascends the channel of the stream, following all its windings, almost to the foot of the Andes. Hence this region, though lying under the equator, and visited by almost constant rains, is neither excessively hot nor unhealthy. Brazil, and the vast country which extends westward from it between the Plata and the Amazon, is an uneven table-land, possessing an equable climate. At Rio Janeiro, which lies low, and is exposed to a heat comparatively great, the temperature in summer varies from 16° to 22° of Reaumur, and the mean heat is only about 19° (74° Fahrenheit.) Farther north, and in the interior, the Indians find it necessary to keep fires in their huts; and in the country near the sources of the Paraguay, hoar-frost is seen on the hills during the colder months, while the mean temperature of the year falls below 65° or 67°. On the declivities of the Andes, and on the high plains of Upper Peru, the heats are so moderate that the plants of Italy, France, and Germany, come to maturity. Lower Peru, though a sandy desert, enjoys a wonderful degree of coolness, owing to the fogs which intercept the solar rays. At Lima, which is 540 feet above the sea, the temperature varies from 53° to 82°, while the average for the whole year is only 72°. In the plains of La Plata, the mean temperature of the year is very nearly the same as at the corresponding north latitudes on the east side of the Atlantic. At Buenos Ayres, for instance, the mean annual heat is 19° 7′ of the centigrade thermometer (68° Fahrenheit), while that of places on the same parallel in the old world is 19° 8′. The range of temperature is probably greater in the basin of the Plata; but as we advance southward, the diminishing breadth of the continent makes the climate approximate to that of an island, and the extremes of course approach each other. In the Straits of Magellan the temperature of the warmest month does not exceed 43° or 46°; and snow falls almost daily in the middle of summer, though the latitude corresponds with that of England. But the inference drawn from this, that the climate is unequalled for severity, is by no mea[illegible]

just, for the winter at Staten Island is milder than in London. In point of fact, climate of Patagonia is absolutely colder than that of places in the same latitud Europe; but the difference lies chiefly in the very low temperature of the sum This peculiarity no doubt arises chiefly from the greater coldness of the sea in southern hemisphere; for beyond the parallel of 48° the difference of temperatu the North and South Atlantic amounts, according to Humboldt, to 10° or 1 Fahrenheit's scale. If we push our researches a step farther, and inquire what is cause of the greater warmth of the northern ocean, we shall be forced to admit th satisfactory reason cannot be given. Something may be due to the influence of gulf stream, a minute branch of which is supposed to carry the waters of the rid zone to the shores of Shetland and Norway; but so feeble an agent seems trifling to account for the phenomenon. The sum, then, of the peculiar qual which distinguish the climate of South America may be briefly stated. Near equator the new continent is perhaps more humid than the old; and within the pies generally, owing to its vast forests, the absence of sandy deserts, and the el tion of the soil, it is cooler. Beyond the tropics the heat is nearly the same in southern temperate zone of America and the northern temperate zone of the old tinent, till we ascend to the neighbourhood of Cape Horn, where we have cold mers, and a very limited range of the thermometer in the western hemisphere.

As nine-tenths of North America lie under the temperate zone, the climate fol a different law from that which is observed in the southern peninsula, and pre more striking contrasts to that of the best known parts of the old world. The narrow region now denominated Central America, which connects the two great sions of the continent, stretching from Panama to Tehuantepec, has in general a humid atmosphere; but, for a tropical country, it must be only moderately ho every part of it is within a small distance of the sea. In Vera Paz rains fall du nine months of the year. Mexico is hot, moist, and unhealthy on the low co but two-thirds of its area, comprising all the populous districts, consist of t land, from 5000 to 9000 feet above the level of the sea. In consequence of singular configuration of its surface, Mexico, though chiefly within the torrid zone joys a temperate and equable climate. The mean heat at the capital, which is feet above the sea level, is 62½°, and the difference between the warmest and co months, which exceeds 30° at London, is here only about 12°; but the atmosp is deficient in moisture, and the country suffers from drought. Beyond the pa of 24°, the western shores are hot and arid

In the extensive region between the parallels of 30° and 50°, which compreh three-fourths of the useful soil of North America, there are three well-marked v ties of climate, those of the east coast, the west coast, and the basin of the M sippi. On the east coast, from Georgia to Lower Canada, the mean temperatu the year is lower than in Europe by 9° at the latitude of 40°, and by 12½° a latitude of 50°, according to Humboldt's calculation. Besides, the range o thermometer is greater than in Europe, the summer being much hotter and winter much colder. At Quebec the temperature of the warmest month exceeds of the coldest by no less than 60½ degrees of Fahrenheit; while at Paris, whi nearly under the same latitude, the difference is only 31°. The climate, more undergoes a more rapid change in America as we proceed from south to north, gree of latitude in the middle of the temperate zone producing a decrease of a temperature of 1·13 in Europe, and of 1·57 in America. The comparison is gr to the disadvantage of America when made in this form; but when the east c of the two continents are compared, the case is altered; the old world is fou have no superiority over the new, for Peking has still colder winters and wa summers than Philadelphia, which lies under the same latitude. It is the west of the new continent which ought to exhibit the climate of Europe; and from the facts known, we have reason to believe that it is quite as mild and equable. At mouth of Columbia River, in lat. 46½°, Captains Lewis and Clarke found the rain be copious and frequent; but they had very little frost, and saw no ice even in depth of winter. From observations made in 1822-3-4, it appears that the m heat of the warmest month was about 62°, that of the coldest about 36°, and of whole year 51°. Now, the latitude is the same as that of Quebec, where the s lies for five months, and the mean temperature during the three winter month 18° below the freezing point. This single circumstance marks emphatically the trast in the climate of the east and west coasts of North America. But the mo of Columbia River is also under the same parallel with Nantes at the mouth of Loire, where snow and ice are not unusual in the cold season of the year. We h

therefore, good grounds for concluding, that the west coast of America, in the middle latitudes, has fully as mild and equable a climate as the west coast of Europe. The climate of the great central valley, or basin of Mississippi, bears a considerable affinity to that of the east coast. It was long a matter of dispute in what the difference between the two consisted; but this seems at last to have been clearly settled, by the meteorological registers kept at the military posts of the United States. From a comparison of four of these registers, kept at posts near the centre of this great valley, with others kept on the Atlantic coast in the same latitudes, it appears that in the hottest month the temperature is from 5° to 6° higher, and in the coldest month as much lower, in the basin of the Mississippi, than on the coasts of New England. The proportion of fair to cloudy weather is as five to one in favour of the east coast. The climate of the interior, therefore, exhibits in still greater excess those extremes of temperature which distinguish the eastern coast of this continent from the western, and from the shores of Europe. The fourth region of extra-tropical America includes the regions beyond Mount St. Elias on the west coast, and, in the interior, the plains which extend from the 50th parallel to the Polar Seas. The intensity of the cold in this tract of country is scarcely equalled by any thing that is known under the same parallels in northern Asia. The most northerly spot in America where grain is raised, is at Lord Selkirk's colony, on Red River, in lat. 50°. Wheat, and also maize, which requires a high summer heat, are cultivated here. Barley would certainly grow as far north as Fort Chippewyan, in lat. 58¾°, where the heat of the four summer months was found by Captain Franklin to be 4° higher than at Edinburgh. There is even reason to believe, that this species of grain and also potatoes might thrive as far north as Slave Lake, since the spruce fir attains the height of 50 feet three degrees farther north, at Fort Franklin, in lat. 65°. These, however, are low and sheltered spots; but in this dreary waste generally, it will not be found practicable, we suspect, to carry the arts of civilized life beyond the 60th parallel; and the desirable country, capable of supporting a dense population, and meriting the name of temperate, can scarcely be said to extend beyond the 50th parallel. At 65° snow covers the ground in winter to the depth of only two feet, but small lakes continue frozen for eight months. The sea is open only for a few weeks, fogs darken the surface, and the thermometer in February descended, in one instance, to *minus* 58°, or 90° below the freezing point. At Melville Island, under the 75th parallel, such is the frightful rigour of the climate, that the temperature of the year falls 1° or 2° below the zero of Fahrenheit's scale. It is a peculiarity in the climate of America, that beyond the parallel of 50° or 52°, it seems to become suddenly severe at both extremities. At the one, summer disappears from the circle of the seasons; at the other, winter is armed with double terrors.—(*Ency. Brit. Article* AMERICA, pp. 611-613.)

VEGETABLE PRODUCTIONS.—The vegetable kingdom in America presents greater diversity than that of any region in the old world, of corresponding climate; and this remark becomes more true as we make a nearer approach to the equatorial zone. Although we are far from being fully acquainted with the flora of America, we may nevertheless affirm that it is richer than that of any other part of the world. More than 15,000 species of phanerogamous plants grow there spontaneously; but we must confine our attention specially to those which, differing in their structure from the plants of other continents, are the peculiar product of the western continent.

The low countries which border the Polar Sea and Hudson's Bay, produce plants resembling those of the High Alps in Europe; and the flora of this region of America is nearly identical with that of Lapland. A few stunted willows, birches, poplars, and pines, are the only trees which can resist the cold. A considerable number, however, of herbaceous plants are remarkable for the large size of their flowers, considering the shortness of their duration; and the rigour of the climate is no obstacle to the development of cryptogamous plants. Mosses and lichens cover the ground of this arctic country, and seem almost to exclude every other vegetable.

Canada and the basin of the St. Lawrence exhibit the transition from the frozen to the temperate zone of America. In Newfoundland are already found the plants of the United States, though the northern flora still predominates. Farther south, species multiply, and are remarkable for their beauty, which is much greater than that of any plants produced in the Old World, in the same latitudes, or in climates of the same temperature. And even among the plants of European species there is greater diversity and elegance in the green-wood trees which decorate the forests of North America. A crowd of plants, produced only by cultivation in Europe, grow naturally in the United States, where the mixture of northern and tropical forms is

to be seen. Michaux has given descriptions of a number of species of native oa the timber of which is harder than the European *quercus robur*. The coniferous trees also exhibit forms extremely various; pines, firs, and junipers, are particularly those most numerous in species. The *myrica cerifera*, a shrub of the amentaceous family, is remarkable for the use which the Americans make of its fruit, the wax cover of which serves for making candles. Among the herbaceous plants which are interesting from their elegance, or the singularity of their organization, we may cite several species of lobelias; and the famous Venus' flytrap, which grows in the marshes with the *cabomba aquatica*, found equally in Guiana and Carolina. A number of European plants also, besides those introduced by culture, grow naturally in this part of America; as the *Linnæa borealis*, *gentiana pneumonanthe*, *saxifraga-aizoon*, and *octopetala*, &c. But these plants belong to the cold country, and contain the least varieties.

The plants of north-west America have a close relation to those of the United States, and of Siberia; and it is from this region that, of late years, a number of plants which now decorate European gardens have been brought.

If we now look to the southern parts of North America, we find a vegetation different from that of the regions already mentioned, namely that of the equatorial regions, modified by the elevation of the country. Thus, while the coasts of Mexico and the shores of the Antilles present the plants indigenous to the warmest regions of the globe, the mountains and high table-lands produce not only those which are related to the plants of temperate regions, but even several species of those which belong to the latitudes nearest the equator. The warm region rises from the level of the sea to about 1900 feet; its mean annual temperature is about 79° Fahrenheit; and the difference of temperature between the eastern and the western coasts of Mexico, and the shores and interior of the islands, is more dependent on their exposure to the prevailing winds, and their elevation, than on the difference of the latitudes. Among the plants peculiar to these warm regions are several palms, scitaginæ, legumes, labiatæ, rubiaceæ, and solaneæ. In the temperate region, the mean annual heat is about 78°; and many trees and frutescent plants are to be met with, particularly oaks. Above this rises the cold region of Mexico, exceeding 7000 feet above the level of the sea, and having an annual temperature varying between 33° and 64°. On the borders of the snow, which covers the tops of the mountains, are found plants indigenous to more northern climates. In the least elevated spots are a great number of plants of European genera, but differing in species. A tree, much admired by travellers, as well for the beauty of its form as for the singular organization of its flowers, grows near Toluca. It is the *cheirostemon platanoides* of Humboldt and Bonpland, named also by other botanists *cheiranthodendron*, names which correspond with its Spanish designation *arbol del manitas*, and convey an idea of the conformation of its stamina, which much resemble the five fingers of the human hand. There are whole forests of it to the north of Toluca.

All the low countries of the equatorial region of America, from Mexico to Brazil and Peru, are characterized by a peculiar vegetation; but we must content ourselves with mentioning the plants useful to man, and those which are so abundant in some countries as to determine their character and aspect. Palms, with the exception of the date-tree and some *chamærops*, grow in all the tropical climates; some grow even on the slopes of considerably elevated mountains, as the *ceroxylon andicola*, which has been met with in the mountains of Quindiu in Peru. The natives gather from its trunk a kind of wax fit for giving light. The other palms in great variety are common in the plains or the hills of all this part of America, principally in Colombia, Guiana, and Brazil, in the last of which they are particularly abundant, and very various. These regions present also to the European, when he first lands on their shores, an admirable prospect in their arborescent ferns, which grow with all the majesty of palms and pine trees. Numerous species of cyatheæ, feterides, aspides, doradilles, &c., form one of the characteristic traits of the flora of the Antilles, New Andalusia, New Granada, the valleys of Peru, and in Mexico, near Jalapa. We may also mention the numerous *cacti*, with stocks resembling vast chandeliers, on the coasts of Cumana, and particularly the cochineal cactus, so valuable to Mexico; the *araucaria* of Chili and Brazil, the cacao, the rocou, the dye-wood of Campeché, the banana, the ananas, &c., which are not only useful in their native countries, but have also become necessary to the arts and manufactures of Europe. Several useful plants have likewise been introduced and successfully cultivated in these countries, as the coffee-tree, sugar-cane, cotton-plant, bread-fruit-tree, &c. In Brazil are found ipecacuanha, cinchona, &c.; and the high mountains of that country present a still greater number of plants than

the plains; among which may be noticed the vellosia, a kind of amaryllis, of which the species are found congregated, and whose expanded branches are covered with blue, violet, or white flowers, as large as our lilies.

In the southern region of America, a vegetation analogous to that of Europe, is found in latitudes nearer the equator. Thus the neighbourhood of Monte Video is covered with plants, which, with few exceptions, belong to the same genera that compose the flora of France. To complete this sketch of the vegetable productions, we should now describe those of Chili, Peru, Buenos Ayres, Patagonia, and Tierra del Fuego; but with respect to Peru, we should only have to repeat much of what we have already stated concerning the vegetation of Mexico and Brazil; for countries which correspond in character and temperature produce plants, if not absolutely the same, at least very similar in their organization. Peru, however, and Colombia, are the native country of the febrifugous cinchona: it was a long time believed that the true cinchona, or Peruvian bark, grew only among the Andes, but M. Auguste de St. Hilaire has found in Brazil three species which rival in their medicinal virtues those of Peru. South America is also considered as the native country of two species of vegetables particularly useful to man, the potatoe and maize; but nowhere has the potatoe been met with in a wild state; though plants with tuberculous roots, of similar appearance, are abundant in different parts of Chili, particularly near Quillota. Maize seems to be indigenous to Paraguay.

Patagonia and the neighbouring islands are very little known; but their vegetation seems to be analogous to that of the north, though characterized by a very singular appearance.

America does not contain a single species of *erica* (heath), nor has a *pæonia* ever been found in it, except a solitary one observed by Douglas to the west of the Rocky Mountains. That mountain barrier indeed divides two classes of vegetation, almost as peculiar as those of two continents. On its eastern side the forests of North America are distinguished by the variety of their oaks and juglandes, the magnificent flowers of the rhododendron, the magnolia, the azalea, and the humbler beauties of the actea and raccinium; all of which are utterly unknown on the western side of the ridge. America is the real habitat of the cinchonaceæ and the cacti, of the fuchsia, the calathea, the mustisia, and all the bromeliaceæ.

ANIMALS.—In most parts of America many new genera are met with in every class of animals, distinct from those of the old world; and few species are found, which are not peculiar to it, with the exception of marine animals. The quadrumana, which range through 29° on each side of the equator, have the peculiarity of either wanting the thumb or the fore paw, or having it so placed, or so imperfectly developed, as not to be a real opponent to the fingers; while the prehensile tails of many, and the hairy buttocks of all, which shew that none of them sit erect, distinguish them from the individuals that most resemble them in the old world. The carnivora of America are almost all peculiar to it; with the exception indeed of some of the marine carnivora, and a very few terrestrial species, all are specifically distinct from those found in other parts of the world. The whole order of marsupiata is either American or Australian; and the species of the one country are unknown in the other. America exceeds every other country in the number of its rodentia; and there is reason to doubt whether any of this order are common to the two great divisions of the world. The edentata are found chiefly in South America, but all are peculiar to the new world. Though America appears to have been, at one time, rich in its pachydermata, as their fossil remains attest, yet at the period of its discovery there were not more than four or five species of this order found on the continent. They were all peculiar, and only one, the dicotyles torquatus or peccary, is common to the northern and southern divisions. Among ruminantia we consider the American rein-deer and elk as peculiar species; and the identity of the ovis montana of the Rocky mountains and the Argali of Siberia as very doubtful. The order of cetacea is probably common to both divisions of the world, with the exception of Cuvier's manatus americanus, which is found on the coast of Florida, and also on that of South America. Dr. Richardson reckons that, out of 207 species of mammifers found in North America, 169 are peculiar to that country; and, if we take Temminck's estimate of this class, North America contains one-fifth of all the known species of mammalia. The same author gives the number of American birds at 696 species, of which 54 are *raptores*, 400 *insessores*, 33 *rasores*, 87 *grallatores*, and 122 *natatores*. Except in the last two orders, the species common to the old and the new world are few, and a great many genera are wholly American. The alligator, the boa-constric-

teristic is the number of its rodentia, amounting to not less th
certained species, only one of which, the beaver, is found in the
are numerous, and among these the wild turkey is the most

siderable number also occur in Europe, and still more of the nata
mer order three species are peculiar to America, and of the latte
lucius abounds in the valley of the Mississippi; where very
syren lacertina of Carolina, and the *meopoma gigantea*, are also
representative in the old world, except the proteus anguineus
lakes of Carniola. Among the numerous tortoises we may noti
ferox, and the *clausa*. The serpents are numerous; the most rema
snakes, of which four or five species are found in this region.

Equinoctial America, or the region which extends from the
on each side, but exclusive of the elevated valleys and table-l
Bolivia, is distinguished by the number of its quadrumana, all o
with tails, and many of them have that organ prehensile, answer
fifth hand. It is also the region of the jaguar, a feline animal
courage. The puma likewise abounds, which, however, has far l
the lion of America than the jaguar has to be called the tiger of
puma has a considerably wider range than its congeners now me
in the woods of America from Brazil to Canada. This region al
tapir, the capybara, and the agouti. The rivers swarm with the
ders far from the sea, as well as a species of porpoise which is as
known. The region is also distinguished by the splendid plum
which numerous genera are either wholly peculiar to tropical Am
unrepresented in other regions. Its raptorial birds are often di
size. To this region belong the magnificent king-vulture, and a
cies of the same family, as large as a turkey, the *vultur uruba*;
harpy eagles, the giants of their tribe, are the tyrants of the lo

mourning snakes, are distinguished for the beauty or elegant pattern of their colours; others, like the rattlesnake or the bushmaster, are dreaded for the virulence of their poison. The fluviatile fishes of the region are remarkable; but we can only notice here the electric gymnote, the soldier loricaria, and the salmo rhombeus; the last of which is the pest of the South American rivers. The *papilionidæ* and *phalænidæ*, among its insects, are noted for their size and the splendour of their colours; and the singular lantern-fly for the brilliancy of its light. The wounds inflicted by the large bird-catching spider, the biting scolopendra, which grow to an enormous size, and by a small species of scorpion, are much dreaded.

The animal productions of the Mexican region, though but imperfectly explored, would seem to justify the inference drawn from its peculiarity of climate that this portion of America should be considered as a distinct zoological kingdom. It has been recognised as the point in which the fauna of North and South America meet. There the wolf of the north and the monkey of the tropics range the same forests; the bunting and the titmouse nestle near the parrot and the trogon; the phalaropé of the north searches for its food on the same beach with the jacana and the boatbill of Brazil. Lichtenstein has pointed out several species of weasels and martins as peculiar to Mexico; the Mexican wolf is probably also a peculiar species. Mr. Swainson states that out of 114 species of Mexican birds, examined by him, 67 are peculiar to that country; yet, among so many species there was but one new genus, *ptiliogonys*, which unites the tyrant shrikes with the caterpillar-eaters; 36 species are common to Mexico and the United States, and 11 to Mexico and South America. The lakes of the valley of Mexico contain that singular animal the *axocotl* of the Mexicans, the *siren-pisciformis* of Shaw, which seems to be intermediate between the other sirens and the protei.

The vast elevation of the greater part of Bolivia and Chili has strongly impressed the fauna of those regions with peculiarities. It is characterized as the region of the guanaco, the alpaca, and the vicuña, three distinct species, which have been sometimes confounded under the name of llama. They are the camels of South America, and were almost the only mammalia subdued and domesticated by the ancient Peruvians. This is also the peculiar region of the Condor, a bird as large as the læmergeyer of the Alps, the largest of the European raptores. It loves to dwell among the snowy solitudes of the Andes, perched on lofty pinnacles, from which it pounces on its prey in the subjacent valleys. The fauna, however, of these countries is still imperfectly explored.

Of the region extending from 30° S. lat. to Cape Horn, including the pampas of Buenos-Ayres, and the southern part of Chili, the fauna has been little explored. Among its quadrupeds are the numerous herds of wild horses and sheep, originally introduced by the Spaniards, but now spread over a great part of South America. The Antarctic and Chilian foxes seem to be peculiar. On its coasts many species of seals are found. The extensive pampas are the chosen haunts of the rhea or American ostrich; and, on its southern coasts, are found the huge, wingless, Patagonian penguin, with the whole genus of *pachyptila*.

At the discovery of America by Europeans the continent was without the horse, the cow, the sheep, the hog, the dog, and the common poultry of Europe; all of which are now spread over it in abundance, and in some places have relapsed into the wild state, in countries suited for their subsistence.—(*From the Article* PHYSICAL GEOGRAPHY, *by Professor Traill, in Ency. Britt. 7th edition.*)

PEOPLE.—The concurrent testimony of all travellers goes to prove that the native Americans are possessed of certain physical characteristics, which serve to identify them in places the most remote; while they assimilate not less in their moral character and usages. There are also in their multitudinous languages some traces of a common origin; and it may be assumed as a fact, that no other race of men maintains so striking an analogy through all its subdivisions, and amidst all its varieties of physical circumstances, while, at the same time, it is distinguished from all the other races by external peculiarities of form, but still more by the internal qualities of mind and intellect. But how are we to group the American nations into families, or, as some writers have attempted, into species? M. Bory de St. Vincent has endeavoured to show that the American race embraces four species besides the Esquimaux; but he has certainly failed to point out any such differences as establish a claim to a specific character. According to Dr. Morton, the most natural division of the Americans is into two families, which he calls the *Toltecan* and the *American*; the former of which bears evidence of centuries of half-civilization, while the latter embraces all the barbarous nations of the new world, with the exception of the Polar tribes, which

branch, they possess, perhaps, a larger and more expanded
and lips. The eyes are small, more or less oblique, and far
and thick; the body and limbs stout and full, even to clumsi
they differ little. None of the Americans are less susceptible

still blacker Californians are 25° N. of the equator. Everywh
that the colour of the American depends very little on the l

epidermis of the Americans; a peculiarity of structure common to them with the African negroes, but entirely wanting in the Caucasian or white race.—(*M. Flourens, Annales des Sciences Nat. December* 1838, p. 361.) The Americans might also be divided into three great classes distinguished by the pursuits on which they depend for subsistence, namely, hunting, fishing, and agriculture. The greater number of them are devoted to hunting; the fishing tribes are not numerous, and are wholly destitute of the spirit of maritime adventure, and even of fondness for the sea. A few tribes were strictly agricultural before the arrival of Europeans, but a much greater number have become so since. Many tribes regularly resort to all these modes of subsistence, according to the seasons; employing the spring in fishing, the summer in agriculture, and the autumn and winter in hunting.

The intellectual faculties of this great family appear to be decidedly inferior, when compared with those of the Caucasian or Mongolian race. The Americans are not only averse to the restraints of education, but are for the most part incapable of a continued process of reasoning on abstract subjects. Their minds seize with avidity on simple truths, but reject whatever requires investigation and analysis. Their proximity for more than two centuries to European institutions has made scarcely any perceptible change in their mode of thinking or their manner of life; and, as to their own social condition, they are probably in most respects exactly as they were at the earliest period of their national existence. They have made few or no improvements in constructing their houses or their boats; their inventive and imitative faculties appear to be of very humble capacity, nor have they the smallest taste for the arts and sciences. One of the most remarkable of their intellectual defects is the great difficulty they find in comprehending the relations of numbers; and Mr. Schoolcraft, the United States Indian agent, assured Dr. Morton that this deficiency was one cause of most of the misunderstanding in respect to treaties entered into between the United States Government and the native tribes. The natives sell their lands for a sum of money, without having any conception of the amount; and it is only when the proceeds come to be divided, that each man becomes acquainted with his own interest in the transaction. Then disappointment and murmurs invariably ensue.

The Toltecan family embraces the civilized nations of Mexico, Peru, and Bogota, extending from the Rio Gila in 33° N. lat. along the western shore of the continent to the frontiers of Chili; and on the eastern coast, along the Gulf of Mexico, in North America. In South America, on the contrary, this family chiefly occupied a narrow strip of land between the Andes and the Pacific Ocean, bounded on the south by the great desert of Atacama. Farther north, however, in New Granada, were the Bogotese, a people whose civilization, like their geographical position, was intermediate between that of the Peruvians and the Mexicans. But, even before the Spanish conquest the Toltecan family were not the exclusive possessors of the regions which we have assigned to them; they were only the dominant race or caste, while other tribes of the American race always constituted a large mass of the population. The arrival of the Spaniards reduced both classes alike to vassalage; and three centuries of slavery and oppression have left few traces of Mexican and Peruvian civilization, except what may be gleaned from their history and antiquities. These nations can no longer be identified in existing communities; and the mixed and motley races which now respectively bear the name, are as unlike their predecessors, in moral and intellectual character, as the degraded Copts are unlike the ancient Egyptians. It is in the intellectual faculties that the great difference between the Toltecan and the American families consists. In the arts and sciences of the former we see the evidences of an advanced civilization; their architectural remains every where surprise the traveller and confound the antiquary. Among these are pyramids, temples, grottoes, bas-reliefs, and arabesques; while their roads, aqueducts, and fortifications, and the traces of their mining operations, sufficiently attest their attainments in the practical arts of life.

With respect to the American languages, it may be sufficient to state, that they exhibit resemblances not less remarkable than those which we have noticed in the physical and moral characteristics of the people. From Cape Horn to the Arctic Sea, all the nations have languages which possess a common distinctive character, but still apparently differing from all those of the old world with which we are acquainted. This resemblance is not of an indefinite kind, but consists generally in the peculiar modes of conjugating the verbs by the insertion of syllables; which gave rise to the remark of Vater, that this wonderful uniformity "favours in a singular manner the supposition of a primitive people, which formed the common stock of the American indigenous nations."—(*Crania Americana, &c. by Samuel George Morton,*

M.D. 1 vol. 4to., Philadelphia 1839: p. 62 to 86.) History and physi
have hitherto completely failed to throw any light on the origin of the
Americans; and it is needless to repeat the numerous hypotheses and c
which have been hazarded on the subject.

According to M. Balbi the American nations employ more than 438 dif
guages, embracing upwards of 2000 dialects; but all the people, he says,
vided into two great classes, namely, the indigenous or aboriginal Amer
those of foreign origin; the latter being the most numerous, and, with the
of the negroes, now forming the dominant people of the whole continent.
bers of all the various races he estimates thus: —

Europeans and their descendants, all of the white race,	14,600,(
Indians, or native Americans, of the brown race, - -	10,000,(
Unmixed Africans, of the black race, - - - - - - -	7,400,(
Races produced by the intermixture of the pure races, -	7,000,(
Total,	39,000,(

And he then gives the following

Table of the People of America, classed by their Languages.

I. INDIGENOUS PEOPLE.

The *Pehcrais* or *Yaccanacas*, a very scanty race, who inhabit Tierra del Fuego, with so
portions of the continental coast. They lead a miserable life, only to be compared with
of the native Australians; they live on shell-fish, and squat themselves in places whe
found most abundantly, moving their habitations only when the supply is exhausted. T
in stature, ill-looking, and ill-proportioned, with a colour resembling old mahogany or
(Sonnini, p. 894.

The *Tehuelhets*, a numerous people of Patagonia, divided into several tribes, which, un
names, wander in the vast solitudes of that country. Some of them are of large statur
even entitled to be called giants, a circumstance which seems to explain the relations of
that all the Patagonians were gigantic.

The *Chilian family* comprises several races, who occupy the high valleys of northern
eastern Chili, beyond the Andes, and also extend from southern Chili into Patagonia.
numerous of them, and the most remarkable, are: The *Aucas* or *Moluches*, called by th
Araucanians; and those who live to the west of the Andes, forming the powerful Arau
federation. This warlike people, after long continued wars with the Spaniards, now live i
the Chilenos. Their territory extends along the coast of the Pacific, from the river Bi
ward, and is divided into four governments, called *uthal mapus*, each superintended by
is independent in the administration of his territory. These four chiefs, with the subs
vernors of provinces and districts are hereditary in the male line; presenting a striking
to the ancient feudal aristocracy of Europe. The Araucanians have been considered the m
of the native American races; they are indeed highly susceptible of mental culture, but
the restraints of civilization, and those of them who have been educated in the Spanish c
embraced the first opportunity to return to the haunts and resume the habits of their na
are a robust and muscular race, of a lighter complexion than the surrounding tribes, a
age with few infirmities. They are brave, discreet, and proverbially cunning; patient in
thusiastic in enterprise, and fond of war. They soon discovered the value of the military
the Spaniards, and especially the great importance of their cavalry, and so early as 15
after their first encounter, they had already several squadrons of horse in their army. Th
ever, only less savage than their neighbours; their agriculture is very imperfect; they
built houses, and have even made attempts to establish a regular form of government.
most numerous race who still preserve their independence. After the Aucas come the *Ur*
who live to the south of the former along the west coast of Patagonia, as far as Tre Stra
lan; their principal tribes being the *Cunchi, Chonos, Pyuns*, and *Kegenas*. The mountain
family have in general a larger stature than the tallest Europeans. Mounted on horses li
tars, they suddenly unite in troops, and make journeys of several hundred miles to ravage
country.

The PUELCHES, who are divided into several tribes, of which some are called *Pampas*
niards, formed one of the most powerful nations of South America. They were found in
southern part of the territory of Buenos Ayres, between the rivers Colorado and Negro
now entirely disappeared from the plains, and the remnant have taken refuge in the Andes

The ATACORY-ARAUCAN FAMILY, to which belong the *Abipones*, a very tall and warlike p
blished in Chaco; and the *Mepenes*, equally athletic, but reduced to a small number by
with the Mocobies.

The PERUVIAN or QUICHUA FAMILY, comprises: 1. The *Peruvians*, who form the princ
the population of Peru, Bolivia, and Equador. Although the Peruvians were ignorant of
writing, and their quippos and symbolic paintings were inferior to those of the Mexicans
nevertheless, at the period of the arrival of the Spaniards, the most polished people of S
rica. 2. The *Aymaras* or *Aymares*, also a numerous race, divided into several tribes,
diocese of La Paz, and part of that of La Plata or Chuquisaca, in Bolivia.

The CHIQUITOS, a numerous people, who wander in the vast region which bears the
Bolivia. A great part of them have embraced Christianity, and have become dependents
livian republic.

The CARAPUCHOS, who live in Peru, along the Pachitea, an affluent of the Ucayle;
ported to be cannibals.

The GUARANI FAMILY comprises four principal nations, subdivided into a great numb
and hordes, spread over Brazil and a great part of Spanish South America. The *Guaran*
so called, live along the Parana, the Uruguay, and the Ibicuy. Converted by the Je
eighteenth century, they presented the singular spectacle of a theocratic or priestly g
powerfully organized; but the seven missions in the Brazilian province of San Pedro, a
sion district to the right of the Parana, in Paraguay, are all that now remain of the Jes
The *Itatinans*, formerly spread, under different names, over all Brazil, but are now r
few tribes. The *Omaguas*, who are now few, and live along the Amazon, formerly acted

part in the history of these regions. In "an enumeration of the various Indian nations, tribes, and hordes, at present found in Brazil," Dr. Von Martius specifies 250 resident in different parts of the empire, the principal consisting of the various branches of the *Tupin* or *Tapinambase* family, of which Balbi's Guaranis are only one. These Tupis or Tupinambases, were formerly the most powerful and most widely extended people in Brazil, but are now, through the predominance of the whites, either losing their nationality and language, or becoming extinct. Their remains, now difficult to be recognised, may be distributed into five distinct groups: 1. The Southern Tupis or Guaranis, in Paraguay, Monte Video, and Rio Grande do Sul; 2. The Eastern or proper Tupis, scattered along the shore from St. Catharine's Island to the river Amazon. They speak the proper Tupi tongue, now called the *lingua geral* (general language) of Brazil; 3. The Northern Tupis, remains of whom are found in Para, and on both sides of the river Amazon, as far as Topinambarana; 4. The Central Tupis, who are now the only portion living in a state of complete independence, occupy the upper portion of the Rio Tapajos; but we possess no accurate or detailed accounts of them; 5. The Western Tupis, who speak the West-Guarani dialect, and consist of the *Chiriguanas* in the province of Santa Cruz de la Sierra, the *Cirionos*, and the *Guarayos*.—(*Journal R. Geog. Soc. Lond.* II. 210.)

The Botecudos or Engerekmoung, known formerly by the names of *Aymores* or *Amboures*, fierce cannibals, who occupy a space parallel to the coast of Brazil, between the Rio Pardo and the Rio Doce. Their principal residences are found along the latter river and the Rio Belmonte, in the provinces of Bahia and Espiritu Santo.

The Mundrucus, a very warlike and ferocious people, the most numerous and most powerful in the province of Para, are found between the Xingu and the Tapajos; but of late almost all their tribes have lived in friendship and alliance with the Portuguese.

The Payagua-Guaycuru Family, which comprises five principal nations. The *Payagua*, in the vicinity of Assompcion in Paraguay; and the *Guaycurus*, along both banks of the Upper Paraguay, where they live by the chase, by fishing, and the produce of their numerous herds of beeves. The chiefs form a sort of aristocratic confederation; and the people are divided into the three classes of nobles, soldiers, and slaves. They have been sometimes called *Cavalleiros*, from their making their military excursions on horseback, which rendered them formidable to all their neighbours. But they now live at peace with both the Spaniards and the Portuguese. The *Payagua* were formerly numerous, and masters of the navigation of the Paraguay, and accompanied the Guaycurus in all their expeditions. They are generally tall, and it is not rare to find among them individuals of more than six feet.

The Guanas, a numerous people in Chaco, in the southern part of Matto-grosso, and in Paraguay The greater part of them have become settled agriculturists.

The Bororos, a numerous people in Matto-grosso.

The Carib-Tamanaque Family comprises several nations, of which the principal are:— The *Caribs*, *Caraibes* or *Carina*, a very numerous people, who formerly possessed all the smaller Antilles, with an immense extent of the adjacent continent. They are still met with in different parts of Guiana, and along the Orinoco. Humboldt has remarked that, next to the Patagonians, the Caribs are the largest and most robust people in the world. They formerly dealt in slaves; but, though very cruel and ferocious, the Guiana Caribs never were cannibals like their brethern in the Antilles, among whom this horrible practice was so common, that all man-eaters have been called *cannibals* (properly *carribals*), from their name. The *Tamanaques*, formerly very powerful but now reduced to a small number, live along the right bank of the Orinoco; to them may be ascribed the symbolical figures sculptured on the rocks, relating to the belief in Amalivaca, who is the chief mythological personage of equinoctial America. The *Guaraunos*, who occupy the delta of the Orinoco, are a sort of sailors, who live on trees or in boats. They are, however, of considerable political importance, since it is in their power to facilitate any military expedition, which may be directed against Colombian Guiana, by the way of the Orinoco. The *Chaymas* and the *Cumanagottes*, numerous tribes established in the department of Maturin; and the *Arawaques*, in the same department, and on the banks of the rivers Berbice and Surinam. The *Warraous* live on the coast of Pomeroun, from Morocco creek near Cape Nassau to the Orinoco; they are few in number, but exhibit remarkable skill in the construction of their piragues.

The Oyampus, a warlike and half nomadic people, now the most numerous race in French Guiana, where they live along the Upper Oyapock, and the Jari or Rouapiri, an affluent of the Amazon.

The Guahiva or Guagivos, a numerous, nomadic, and ferocious race, wander along the lower Meta, from the mouths of the Pauto and the Cassanara to its confluence with the Orinoco. They are a source of great terror to their settled neighbours.

The Ottomaks, a miserable, ferocious, and dirty race, established along the Orinoco, between its two affluents, the Sinaruco and the Apure, and particularly in the mission of Uruana. They are in the practice of eating with impunity a kind of earth, which during the period of the inundations, forms their principal food.

The Manitivitanos, a ferocious and warlike people in alliance with the Portuguese, and established on the banks of the Rio Negro.

The Marepizanos are neighbours of the Manitivitanos.

The Manaos, a people of the province of Para, are still numerous and warlike, though much less so than formerly, when they possessed the whole course of the Urarira, an affluent of the Rio Negro, and extended as far as the Rio Chiuara. Great part of them have embraced Christianity, and live intermixed with other people along the Lamalonga, Thomar, &c.

The Saliva Family comprises several races, of which the principal are:— The *Saliri* or *Salivas*, an agricultural people, were formerly powerful, but are now much reduced; they are, however, still numerous in different parts of Spanish Guiana. They have a great taste for music; and the Jesuits having cultivated that taste, the Salivi have become celebrated throughout the region of the Orinoco, as expert instrumental musicians. The *Macos*, or *Macusi*, called *Piuroas* by the Spaniards, a numerous agricultural people, of gentle manners, are found along the Upper Orinoco and its affluents.

The Caverre-Maypure Family, of which the principal nations are:— The *Caveres* or *Cabres*, formerly numerous, powerful, warlike, and addicted to cannibalism, are now reduced to a small number in the missions of the Orinoco. The *Guaypunabis*, established along the Upper Orinoco, are incontestibly cannibals, though, in other respects, the most civilized of all the dwellers on the Upper Orinoco. The *Maypures*, also on the Upper Orinoco, formerly numerous and powerful, are now reduced to a small number. The *Moxa*, a numerous race, occupy a large portion of the province of Moxos in Bolivia; but a great part of them are subjects of the Missions.

The Goahiros occupy the north-western part of the peninsula formed by the Gulf of Maracaybo and the Caribbean Sea. They maintain commercial relations with Jamaica, and several of them speak English. They hold in subjection the *Cocinas*, another barbarous race who occupy the eastern coast of the same peninsula.

The Cunacunas, a warlike people, who occupy the eastern part of the isthmus of Panama.

The Maynas or Mainas, a numerous and warlike nation long established in the country to which they give their name, along the Morona and the Lower Pastaza.

The Changuenes, a numerous, warlike, and cruel people, established in the eastern part of Costa-rica, in Central America, who are the terror of all their neighbours.

The TAUKAS, TOWEAS or XICAQUES, to the south, the MOSCOS or MOSQUITOS, in the middle, and the POYAIS, to the north-west, are the three principal nations, who live along the coast of that part of Central America, between Honduras and the Isthmus of Panama.

The CHOLS or CHOLES, a numerous race, who dwell on the confines of Yucatan and Vera Paz.

The LACANDONS, a numerous people of Yucatan, where they occupy the banks of the river Passion, and possess a great many canoes.

The MAYA-QUICHE FAMILY. The *Mayas* or *Yucatans*, form the great majority of the people of Yucatan, and of a part of Tabasco; their ancestors were nearly as far advanced in civilization as the Mexicans. The *Mames* or *Pocomams*, a numerous people of Guatemala and San Salvador. The *Quiches*, *Kachiqueles*, and *Kachis*, are numerous tribes in Guatemala, where they were formerly dominant.

The CHAPANEQUES, in Chiapa, who, at the period of the arrival of the Spaniards, formed a powerful republic, and had subjected several neighbouring tribes. Their traditions speak of Vodan, grandson of an illustrious old man, who was saved from the great inundation in which the greater part of mankind perished, by means of a raft. Vodan took a part in the erection of a great building by which men undertook to reach the skies; but the work was interrupted; each family received thenceforth a different language, and the great spirit, Teoth, ordered Vodan to go and people the country of Anahuac. It is impossible, says the author of Views of the Cordilleras, not to be struck with the resemblance between these ancient traditions of the Americans and those of the Hebrews.

The MIXTEQUES, a numerous people of Oaxaca.

The ZAPOTEQUES, a numerous people of the same state, whose ancestors were distinguished by their progress in civilization, even before they were subjected by the Mexicans. Humboldt ascribes to them the famous palace of Mitla.

The TOTONAQUES, a people extended over a great part of Vera Cruz and the district of Zacatlan, in the state of Puebla.

The MEXICAN FAMILY. The *Mexicans* or *Aztecks* occupied the country from 37° N. lat. to the lake of Nicaragua. Their division of the year, more exact than that of the Greeks and Romans; their ideographic writing; the art of cutting large blocks of stone; their maps of their country, and of the regions which their ancestors had overrun; their cities, roads, dykes, canals; immense pyramids very exactly set to the cardinal points; their civil, military, and religious institutions; altogether entitled this people to be considered as the most civilized race found by Europeans in the New World. Their monuments long forgotten, have recently attracted the attention of the learned in Europe and America. The *Toltecks*, to whom is attributed the construction of the pyramids of Teotihuacan and other ancient monuments, have long since disappeared. They were regarded as the principal stock of this family, to which belonged also the *Mecos* and the *Pipils*, the former of whom wander in the vast solitudes of Durango, and disturb and harass their peaceful neighbours. The Pipils, descended from a Mexican colony, live in San Salvador near Sonsonata, San Salvador, and San Miguel.

The OTHOMS, a numerous race, spread over the dioceses of Mexico, Puebla, Mechoacan, and Guadalaxara.

The TARASQUES, a numerous people in Mechoacan, distinguished for the mildness of their manners and their industry in the mechanic arts.

The TARAHUMARA FAMILY, a numerous people who are found in the missions of Tarahumara, in the diocese of Durango, extending through a part of the valleys of the Sierra Madre, from the 24° to the 30° N. lat.

The YAQUI or IAKIS, a numerous people of Sonora, who live along the Yaqui or Hiaki river.

The MOQUI, a peaceable, agricultural, and somewhat civilized people, who live along the northern bank of the river Yaquesila.

The APACHES, a numerous nation divided into several tribes, spread over the country from San Louis de Potosi to the northern extremity of the Gulf of California. With few exceptions, these tribes are nomadic; they are very troublesome to their Spanish neighbours, whom they alarm with frequent and terrible attacks. Their warriors are mounted on horseback, and armed with long lances.

The PANIS-ARRAPAHOES FAMILY comprises several nations. The *Panis* or *Pawnees*, a numerous and warlike people, who occupy three large villages on the banks of the Wolf river, an affluent of the Platte. They are engaged in constant war with the Sioux, the Osages, the Konzas, the Corneilles, and others. One of their most powerful tribes, the *Skeje* (Wolf-Pawnees), has abolished the human sacrifices which they used to make every year to the planet Venus, before commencing their rural labours, in order to obtain a rich harvest. The *Arrapahoes* or *Arrapahays*, a numerous tribe who live along the Platte, between the Pawnees and the Canenawish. These, and other kindred tribes, who are warlike and excellent riders, form a sort of confederation, not only formidable to the natives, but also troublesome to the Spaniards, particularly to those who are established along the eastern and northern frontiers of Mexico. The *Ietans*, *Tentans*, or *Tetans*, a nomadic, powerful, and still numerous people, named *Camanches* or *Camanches* by the Spaniards, and *Paducas* by the Pawnees and Osages, wander in the extensive countries comprised between the sources of the Missouri, the Upper Arkansas, the rivers of Trinidad, Brazos de Dios, Colorado, and Rio Bravo del Norte, and the Sierra Madre, and Sierra dos Mimbres. Like other Americans they have learned to ride on horseback; they pass with great rapidity over immense distances, carrying desolation and death into the Spanish settlements, whose inhabitants are thus obliged to travel only in armed bodies.

The COLUMBIAN FAMILY comprises a great number of independent tribes spread over the basin of the Columbia River, and the upper part of the basin of the Missouri. The principal tribes are: The *Tushepaws*, who live near the sources of both rivers, and extend for some distance down the Columbia. The *Multnomah*, whose principal tribe occupies the island of Wappatoo, at the confluence of the Multnomah with the Columbia. The *Shahala*, who live to the right of the Columbia, below the confluence of the Canoe river. The *Snake Indians*, also named *Alpatan* and *Shoshonees*, wander along the southern affluents of the Columbia, and particularly the Lewis and the Multnomah. It may be said generally of all the members of this family, that they have mild manners, live in well-built cabins, and subsist almost exclusively on roots and fish. Nearly the whole of them flatten artificially the heads of their children; on which account they have received the general English name of *Flatheads*. The *Shoshonees*, the *Chopunish*, the *Sokulks*, the *Eschelouts*, the *Enechurs*, and the *Chilluckittequaws*, are good horsemen, and the first three tribes possess a great number of horses.

The SIOUX-OSAGE FAMILY comprehends a great number of independent tribes. The principal are the *Sioux* or *Dacotas*, called also *Ochenti-shakong*, *Nawcotah*, and *Nadowessies*, who are the most numerous, and most powerful of all the remaining North American races. They are subdivided into a great number of tribes, of which the *Dacotas* and the *Assiniboins* are the most powerful. The Dacotas properly so called occupy the vast region which extends along the Middle Missouri, the St. Peter's River, the upper Mississippi, the upper Red River, Lake Winnipeg, and their affluents, from the 42° to the 47° N. lat. The Assiniboins, named *Hoha* (the Revolted) by the Dacotas, also *Stone-Sioux* and *Assinepotue*, live in alliance with the Chippeways, to the north of the Dacotas, and to the west of Lake Winnipeg, to the north of the Pembina; and along the Assiniboin, Saskatchawan and Moose rivers. They have a feud with the Blackfeet, and extend their excursions to the Rocky Mountains; and with their kindred the Dacotas, they have carried on an exterminating warfare since the commencement of the 17th century. All the Sioux form a confederation of independent tribes, who unite

in a general council on matters of common interest. To this council each tribe sends a deputy. The Sioux begin their year at the vernal equinox, while their neighbours the Chippeways begin theirs at the summer solstice. They have no division by weeks, and reckon their time by sleeps or nights. The *Omawha* or *Maha*, whose principal residence is at a great village on the Elk-horn, an affluent of the Platte, are divided into several tribes. The *Mandanes*, a scanty race, live along the banks of the upper Missouri, in two villages. They are remarkable for the singularity of their religious faith, and for the great whiteness of complexion of some of their members. The *Wawsash*, generally called *Osages*, a brave and warlike nation, live in large villages, and carry on implacable hostilities with their western neighbours; but live in friendship with the Sakis and the Konzas. They are chiefly agricultural, and occupy the district which bears their name, in the state of Missouri. They are divided into three principal branches, several of which have embraced Christianity, and have made considerable progress in civilization.

The MOBILE-NATCHES or FLORIDIAN FAMILY comprises six principal independent nations, each subdivided into several tribes. The *Natches*, now almost extinct, were formerly very powerful; the existing remnant is dispersed among the Creeks, Chickesaws, and others. They were particularly remarkable for their monarchical government, their great civilization, and for the worship which they rendered to the sun, in a temple where they maintained a perpetual fire. The *Muskohges* or *Creeks* occupy several fertile valleys comprehended within the States of Alabama and Georgia, where they live in towns and villages. They have made great progress in civilization, and have instituted schools for the instruction of their children. They are divided into two principal branches. The *Upper Creeks*, or Creeks properly so called, occupy the higher parts of Alabama, where they form a powerful confederation, with a president styled Myco. The Lower Creeks, called also *Seminoles*, occupy the plains traversed by the river Flint; they are much less civilized than the Creeks; but are very warlike, and have for several years maintained an obstinate and destructive warfare with the military force of the United States, who are endeavouring to subdue or remove them. The *Chickasaws*, a numerous people, now united with the *Yazous*, live in the northern part of the State of Mississippi. They have made rapid progress in civilization, and have already collected themselves into large villages, where they live by cultivating the ground: at the beginning of the 18th century they were the dominant people of this region. The *Chactaws* or *Choctaws*, called also *Flatheads*, are a numerous agricultural people, who live in the States of Mississippi, Louisiana, Arkansas, and Alabama. The *Cherokees*, a numerous race, whose territory comprises the north-west angle of Georgia, the north-east of Alabama, and the south-east of Tennessee; but by a treaty made with the United States they have agreed to transport themselves to the west of the Mississippi, where a tract of country has been allotted to them. In 1818, about a fourth part of the nation, preferring the wild life of their fathers, removed to the banks of the Arkansas, while the rest abandoned the savage state, and adopted the religion and the usages of their civilized neighbours. They now occupy commodious houses, and possess 70 villages. Some of them have well-cultivated farms, and large stocks of cattle; while others, devoting themselves to mechanical arts, manufacture stuffs, and possess flour and saw mills. The most of them can read, write, and cypher; and almost all speak English. They have established a library, a museum, and a weekly journal, called the Cherokee Phœnix, which is published by a Cherokee, in the national language, with an English translation; and in 1827 they formed and promulgated a constitution, under which their government is composed of three distinct powers, legislative, executive, and judicial, in imitation of that of the United States.

The MOHAWK, HURON, or IROQUOIS FAMILY, consists of a great number of tribes, comprising the remaining descendants of much more numerous and powerful races. The *Mohawks*, now reduced to a small number, dwell partly near Niagara, and partly on the bay of Kenty. They formed part of the confederation called the Five Nations. The other members were the *Senecas*, *Onondagoes*, *Oneidas*, *Cayugas*, *Tuscaroras*, *Canoys*, *Mohegans*, and *Nauticokes*. The first five are named *Maquas* by the early Dutch voyagers, and Iroquois by the French. At the period of the French settlement of Canada, the Five Nations occupied the country between Montreal and lake Champlain; at the time of their greatest power they subjugated the Chippewayan family, and were always the allies of the English. In 1794 most of them began to devote themselves to agriculture and the breeding of cattle. The Mohawks of Canada have adopted the European costume. The *Senecas*, who are now the most numerous of these races, though they do not exceed 1600 individuals, live in the states of New York and Ohio, and make the nearest approach to the whites in their dress and manners. The *Hurons*, formerly a powerful nation, to the east of the Huron, are now reduced to a small tribe, who live on the western shore of lake St. Clair; while a small part of them occupy the village of Loretto, nine miles from Quebec, where they have become catholics, and devoted themselves to agriculture.

The LENNAPPE or LENAPE FAMILY. The *Shawanos*, once a numerous and wide-spread people, have only a few small remnants on the Upper Wabash in Indiana, near the sources of the great Miami in Ohio, and in Illinois. The *Mequachaques*, one of their tribes, like the Levites of old, have the exclusive charge of their sacrifices and religious services; while the *Kikkapoos* are noted for their warlike propensity. The *Sakis*, *Sauckees*, and *Ottogamies*, called also *Foxes*, are two other fragments of the same great nation; who live along the Upper Mississippi and its affluent the Ayooa. They are the allies of the Sioux, are stationary, and cultivate maize. The *Miamis* and the *Illinois* are the best known of all the tribes of this nation, to which seem also to belong the *Pottowatameh*. The most of them live in Indiana, Illinois, and Michigan. The *Pottawatameh* and *Winnebagoes* have sold to the United States all their lands south of the Wisconsin, with the exception of a few lots. The *Lenni-Lennape* or *Lenopea*, named *Delawares* by the English, and *Loups* by the French, were formerly very numerous, and spread over a great part of the east coast of the United States. The remains of them now live in Indiana and Ohio. The *Mahicanni* or *Mohicans*, and the *Abenaqui* are the two principal branches of a numerous nation, who formerly lived in New England and New York. The most of them, now called the *Stockbridge Indians*, have united with the Five Nations; but a small number are still found at the east end of Long Island. The *Micmaks* or *Gaspesiens*, formerly very numerous, and spread over all the east coast of Canada, New Brunswick, Nova Scotia, and Newfoundland, are now found only on the south-west coast of Nova Scotia, and in the interior of Newfoundland, where they are still savage idolaters, while the others have all become Christians, and made rapid progress in civilization. The *Algonquins* and the *Chippeways* are the two principal and best known branches of a nation spread over Canada, in Michigan, Huron territory, and the district of Mandanes in the United States. They are always at war with the Sioux, and use fire-arms. The *Knistenaux*, a numerous people, scattered over all Lower Canada, part of Labrador, and New South Wales, and still farther west. The *Nenawehk* live along the Severn, and the *Abbitibes*, along the river and lake which bear their name. The *Chippewyans* or *Chepayans*, whose numerous tribes are spread over the basin of the Mackenzie, the Coppermine river, and part of that of the Tacoutche-Tesse. The *Carriers*, in New Caledonia. The *Indians*, who dwell in the neighbourhood of Santa Barbara in California, belonging to this family, are few in number, but remarkable for their civilization.

The WAKASH or NOOTKA, a very warlike nation, live in large towns on Quadra's and Vancouver's Island, which from them would be much more appropriately and less awkwardly named Nootka Island.

The KOLUCHE or KALOCHE FAMILY, to which belong the people who live along the coast from Jakutat to Queen Charlotte's Islands, are all remarkable for their courage, their industry, and their ingenuity and practical skill in the construction of their houses, canoes, and implements of war and

fishing. They also construct drinking vessels, pipes, and other articles of a soft argillaceous stone; and these objects are at once symmetrical in form, and elaborately decorated with figures.

The ESQUIMAUX consist of five principal nations, of which one belongs to Asia. Those of the new world are divided into three principal branches, namely, the *Karalits* or *Kalalits*, who inhabit Greenland; the *Esquimaux* properly so called, who live on the north-east coast of Labrador; and the *Western Esquimaux*, who wander near the mouths of the Mackenzie and the Coppermine rivers, and other places along the Polar Basin. To this family belong also the *Aleutians*, who inhabit the long chain of the Aleutian Islands, and the western extremity of Alashka. The *Aglemoutes* or *American Chuckches*, live under the protection of Russia, along the Nussegak. Other tribes of the same nation are found in the islands of Nuniwok and Stuart, and along a part of the adjacent coast. Others, under the name of *Kitegmes*, occupy the American coast from Behring's Strait to Kotzebue's Gulf. Some live in the Isle of Chunakak, known also by the names of Chibono, St. Lawrence, Sindow, and Clerk Island. Some writers suppose the Esquimaux to be a part of the same original stock with the other Americans, partly because there is some resemblance between them in features, partly from partial analogy of language, and partly from a determination to merge the American in the Mongolian. It is obvious nevertheless, says Dr. Morton, that the continent of America was originally peopled, as it is yet, by a very distinct race, and that the Esquimaux arriving in small and straggling parties from Asia, necessarily adopted more or less of the language and customs of the people among whom they settled, or with whom they came in contact. Hence the Esquimaux, and especially the Greenlanders, are to be regarded as a partially mixed race, among whom the Mongolian physical character predominates, while their language presents obvious analogies to that of the Chippewyans, who are their neighbours to the south.—(*Crania Americana*, p. 63.)

The Caucasian or White races who have settled in America belong chiefly to the nations of Western Europe. The Spaniards colonized Mexico, the northern, western, and central portions of South America, and part of the West Indies; the Portuguese colonized Brazil; and the English colonized the eastern part of North America. French settlements were also widely extended along the St. Lawrence and Mississippi; and in Canada the French still form two-fifths of the population unmixed. Numerous Dutch colonists settled in New York and in New Jersey. To these have been added Swedes, Germans, Swiss, Scots both Celtic and Saxon, and Irish, in great numbers; and out of all these has been formed the great Anglo-American family, which is now rapidly spreading over all the habitable portion of North America.

African negroes, in large numbers, have been, during the last three centuries, imported into America, as slaves. Pure negroes still form nearly a fifth of the total population; while the race sprung from their intermixture with the white and brown races are also very numerous. The slave-holding states are the southern portion of the American Union, Texas, the Spanish, Danish, Dutch, and French colonies, and Brazil; in the last of which the slaves are particularly numerous, and of the most ferocious character. All the negroes in the British possessions are now free, and have shown themselves, since they acquired their freedom, to be a peaceable and well-disposed people. The negroes and mixed races of Hayti recovered their freedom, and established their national independence during the period of the French Revolution; but as yet they have made no very great or rapid progress in civilization.

RELIGION. — All the European colonists, and many of the aborigines profess Christianity, but several of the independent tribes are still addicted to fetichism, or to what may be called sabeism or dualism. It is very remarkable, that among all the tribes, however savage, we find an idea, more or less clear, of a Supreme Being, who governs the heaven and the earth; of an evil spirit who shares with him the dominion of nature; and of the immortality of the soul, or rather, of a future state of existence. Several of the tribes have priests or conjurers; some have neither; but all believe in the existence of invisible beings and of a future life. Some represent God under the form of a star; some as an animal; some, on the contrary, see him only in the phenomena of nature. A great number of religious creeds, based on supposed revelations, as well as the religions of the ancient Mexicans, Peruvians, and Muyscas, have disappeared with the conversion to Christianity of those who professed them; but some part of the creed and religious practices of the three last-mentioned nations, seem still to be preserved among their descendants. It is even curious to observe, in the ancient worship of Peru, traces of the Hindoo trimurti; to meet with the doctrine of transmigration in the creed of the Tlascalteks; to see the Pastoux, in the centre of South America, living on vegetables, and abstaining from flesh; and to find among the Mexicans, traditions of the mother of mankind having fallen from her estate of innocence and happiness; of a great flood, in which a single family escaped on a raft; and of a pyramidal edifice raised by the pride of mankind, and destroyed by the wrath of the gods; ceremonies of purification at the birth of children; images made of maize flour, and distributed in portions to the people assembled in the temples; confession of sins made by penitents; and religious associations resembling those of the monks and nuns of Europe. At the arrival of the Spaniards human blood flowed in the *teocallis* or temples of the Mexicans and the Mayas; and the Peruvians offered at Cuzco, before the appearance of Manco-Capac, all the cruel sacrifices of the Hindoos. Even the worship of the sun, introduced by the Incas, though a milder form of religion, was not free from human sacrifices; thousands of human victims were immolated on the tomb of the monarch. The cannibals of Brazil had a less sanguinary worship, and their creed bore a very distinct impress of dualism, which is still met with among the people of this vast continent. The Cahetes, however, are said to have had neither creed nor religious ceremonies.

The people of the Upper Orinoco, Atapapo, and Inirinda, have no other objects of worship than the powers of nature. They give the name of Cachimana, or the

Manitou, to the Great Spirit who rules the seasons, and provides the harvests. Besides Cachimana there is an evil spirit, named Jolokiamo, who is less powerful, but more cunning and more active. Along the banks of the Orinoco, says Humboldt, there is no idol; but the *botuto*, or sacred trumpet, is an object of veneration. As a qualification for a person to be initiated into the mysteries of the botuto, and become a *piache* or conjurer, he must be of pure morals, and remain in celibacy. The initiated submit to flagellations, fasts, and painful exercises. There is only a small number of the sacred trumpets; the most celebrated of which is placed on a hill near the confluence of the Tano and Rio Negro. Women are not allowed to see this marvellous instrument; and are even excluded from all the ceremonies of worship. If one of them should happen to see the trumpet, she is put to death without pity.

The Sioux, the Chippeways, the Sakis, the Foxes, the Winebagoes, the Menomenes, and other tribes of North America, all believe, perhaps, in a Great Spirit; but there is no individual among them who has not a favourite object of reverence, in some animal, tree, herb, or root. Every chief of a family, every old woman, and almost every individual, has a collection of herbs and medicinal roots, which they call the medicine bag, and regard as the sanctuary of so many divinities. They keep it carefully in their tents, and never separate from it when they are at war, or on a journey. Among several of these tribes, when they are settled for a portion of the year, there are huts, where girls are placed to watch over the fire which is kept burning in the centre, like the Roman vestals, the Peruvian virgins of the sun, the guardians of the prytaneum at Athens, and the Guebres of Persia and India. It seems to be considered as an emblem of the sun, or at least is consecrated to that vivifying luminary.

The religion of the Araucanians, Natches, Choctaws, and some other tribes, is a kind of Sabeism. The Cahans make the most extravagant gestures in addressing their prayers to the Supreme Being, whom they implore every morning. The Knistenaux regard as spirits the fogs which cover the marshes of their country. The Chippewyans believe themselves to be descended from a dog, and consequently regard that animal as sacred; they represent the Creator of the world under the figure of a bird, whose eyes flash lightning, and whose voice produces thunder. They have also traditions of a great flood, and of the long life of the primitive human race.

Among several of the North American tribes, and even among some of those in the South, fanaticism occasions scenes not less cruel than those with which the Hindoos celebrate their Currack pûja; but our space does not allow us to enumerate ceremonies which are almost as various as the tribes that practise them.

Christianity is professed by all the European colonists, and by many Indian converts. The Catholic Church is dominant and exclusive in Brazil and all Spanish America; but in some of the more remote regions, the natives preserve their ancient idols along with the images of the saints; crown them with flowers, and address them in secret prayers. There are also a great many Catholics in the United States and in Canada. In English America, or the United States and British territories, all the various sects of Protestants are found, and also a few Jews.

DIVISIONS. — America is naturally divided into three great portions, namely, *North America*, *South America*, and *West Indies*; but, politically, it is divided into a number of independent states and territories, with the foreign possessions of European powers. These we shall describe in the following order: 1. Russian America; 2. British Continental Territory in North America; 3. United States of North America; 4. Republic of Texas; 5. Mexico; 6. California; 7. Yucatan; 8. United States of Guatemala, or Central America; 9. New Granada; 10. Venezuela; 11. Equador; 12. Peru; 13. Bolivia; 14. Chili; 15. United States of the Rio de la Plata; 16. Paraguay; 17. Uruguay, or Banda Oriental; 18. Empire of Brazil; 19. British, French, and Dutch Guiana; 20. Patagonia; 21. The Islands. 22. To these we shall add the *Arctic Regions*, or *Greenland* and *Spitzbergen*.

I. *RUSSIAN AMERICA.*

This territory comprehends the north-western portion of the continent, extending from Behring's Strait eastward to the meridian of Mount St. Elias, along both the Arctic and the Pacific Oceans; and from that mountain southwards, along the maritime chain of hills, till it touch the coast, about 54° 40′ N. lat., forming an area of about 390,000 square miles. It is in the immediate possession of the Russian American Company; and the settlement originated with a company or association of merchants formed at Irkutsk, who obtained from the Emperor Paul the exclusive privilege of trading for peltry in the Aleutian Islands and the adjacent coasts. This privilege was extended by the Emperor Alexander over all Russian America. The capital and principal factory was first established at Kodiak; but the increasing scarcity of sea-otters in the Aleutian Islands, and the necessity of pursuing them farther south, led the then governor to lay the foundation of New Arkhangel, which has now become the capital. The Russian dominion, however, over the vast solitudes of this region is merely nominal,

Some of the tribes who live along the coasts, sell or barter furs with the Russians, and ackn the sovereignty of the empire; but most of them, as well as those in the interior, are quite i dent. We may even say that the greater part of the interior is quite unknown to the Russi possess merely some small establishments on the coast, and some posts surrounded with ditc palisades, which are dignified with the title of forts. *New Arkhangel*, the capital, situate on coast of Sitka Island, in N. lat. 57° 3', and W. long. 135° 13', is a town with about 1000 inhabita contains the boards and warehouses of the Company. The thermometer falls below 2° Fahr January and February, which are the coldest months; the mean temperature of these months 34°; in August it is 57° 7'. The Russians have also a settlement at *Bodega*, on the coast of Ca 38° 30' N. lat., where they cultivate a fertile tract which extends several miles inland. Th along the coasts, within the Russian limits, are:—*Queen Charlotte's Island*, *Prince of Wales Sitka*, *Admiralty*, *Kaye*, *Montagne*, *Kodiak*, and the long chain of the *Aleutian Islands*, whic from Alashka to Kamtschatka, a distance of about 600 miles, and consist apparently of the su a range of submarine volcanic mountains, several of which are in constant activity. *Behring' Attoo*, *Oonimack*, and *Oonalashka*, are the principal. Oonimack contains enormous volcan of which, *Chichaldinsk*, is about 9983 feet above the level of the sea. The volcano of *Makus* Oonalashka, rises to 5491 feet. All the islands present a barren aspect, with high and coni faces, which are covered with snow during great part of the year. Vegetation is scanty, a are no trees or plants larger than shrubs and bushes. The inhabitants are of a middle size, brown complexion, and apparently intermediate between the Mongolian and the America Their chief occupation used to be hunting sea-otters, sea-lions, and seals; but the unsparing u of these animals has now made them very scarce.

II. *BRITISH CONTINENTAL TERRITORY IN NORTH AMERICA.*

This region comprises the *Hudson's Bay Company's Territories*, *Canada*, *New Brunswick*, *Nova Scotia*, and *Honduras*.

The *Territory of the Hudson's Bay Company* includes *Labrador* and *East Maine*, on the east; *New North Wales* and *New South Wales*, on the west side of Hudson's Bay, with the interior c farther west as far as the Arctic and Pacific Oceans, and the Russian frontier. The western of this dreary country is intersected by numerous rivers, lakes, and marshes; the ground where barren and desolate; the sea is open only from the beginning of July till the end of Sep and, such is the severity of the climate, that even in 57° N. lat. the lakes freeze eight feet thick congeals; rocks split with a noise resembling that of the loudest artillery, and the shattered fr fly to an amazing distance. The weather is capricious, and the changes sudden. The aurora sometimes sheds a light equal to that of the full moon. There is great abundance of berry shrubs, and culinary herbs. In some places terebinthines are common, and other trees attai siderable size. On Red River different kinds of culture succeed well. Animals are somewha rous, as the buffalo, rein-deer, musk ox, fallow-deer, beaver, wolf, fox, catamount, wild ca black, and brown bears, wolverine, otter, racoon, musk rat, mink, pine-martin, ermine, po hare, various squirrels, and mice. The northern and eastern coasts are inhabited by M tribes of the Esquimaux family; the interior and southern portions, by aboriginal America all live by hunting and fishing, and by exchanging the produce with the European traders. trade of the region is carried on by the Hudson's Bay Company, whose head-quarters and p depot is *York Factory*, 5 miles above the mouth of Hayes River, in N. lat. 57° and W. long. The Company has nearly 1000 persons in its employment; and has formed a settlement on Re for the retired officers and servants.

Labrador is a triangular peninsula, bounded on the east by Davis' Straits; on the south, by and the gulf of St. Lawrence; and on the west, by Hudson's Bay. But it is as cold and barre countries above described; and is, besides, constantly enveloped in fogs. The interior, how somewhat milder than the coasts, and produces various trees, with celery, and other plants. face is a mass of mountains and rocks, interspersed with innumerable lakes and rivers, which with the best species of fish. The country swarms with beavers and rein-deer, and bears. The elder-duck and innumerable other birds frequent the eastern coasts. The Moravian l have established three settlements, at *Nain*, *Okkak*, and *Hoffenthal*; and, besides preaching th have taught the Esquimaux many of the useful arts of life, and thereby partially civilized al their influence.

§ 1. *Canada.*

SITUATION AND EXTENT.—This extensive region is situate between 42° a N. lat. and 61° and 81° W. long.; being about 1400 miles in length from west, and varying in breadth from 200 to 400. In 1791 it was divided into t provinces of Lower and Upper Canada, which have been again united, for legi purposes, in the present year (1841). Canada forms a long narrow tract of c extending south-westward from the sea, along both sides of the river St. Law as far as the 45° N. lat, and from the point where that parallel crosses the r stretches westward along the northern bank of the Cataraqui, and the northern of the lakes Ontario, Erie, Huron and Superior, including the peninsula form Lake Huron on the west, and Erie and Ontario on the south and south-east river Ottawa forms the common boundary between the two provinces throu greater part of its course.

GENERAL ASPECT.—Canada is intersected by mountainous ridges, which from the coast far into the interior, and between these lie extensive valleys, are generally fertile. On the northern shore of the St. Lawrence a ridge of l rises near the eastern extremity of Lower Canada, which stretches close to th for upwards of 100 miles, and forms its rugged banks as far as Cape Tourment, thirty miles below Quebec. Here the ridge, taking a direction west-south-we minates on the river Ottawa, about thirty-eight leagues above its confluenc

the St. Lawrence, after extending from Cape Tourment along the course of the river about 300 miles. The tract of country lying between it and the St. Lawrence, which may be estimated at from fifteen to thirty miles in breadth, is beautifully picturesque, well watered, and level. Towards the west, more especially, it may be considered, in respect of population, soil, and skilful cultivation, as the choicest part of the province.

That part of Canada which lies on the north side of this ridge is comprehended within the Ottawa river on the north-west, the 81st parallel of west longitude, and the 52d of north latitude. It is intersected by another and higher range of mountains, which runs into the interior in a north-west direction, at the distance of about 200 miles from the former ridge, and which forms the watershed by which the tributary streams of the St. Lawrence are divided from those that fall into Hudson's Bay. Of this extensive wilderness, which has been but imperfectly explored, we know only that it is covered with immense forests, whose dreary solitudes are interrupted merely by hunting parties of wandering savages.

On the south side of the St. Lawrence, a ridge commences nearly 100 miles below Quebec, which takes a south-west direction; and opposite to this city, is about ten leagues distant from the river. The intervening country is a fertile and well-cultivated level, with several insulated hills, or rather rocks, of a singular form, and thinly covered with small trees near their summits. The same chain, continuing in a south-west direction, crosses the boundary line between Canada and the United States to the west of Lake Memphremagog, and proceeds in the same course until it meets with the Hudson river. The tract between this ridge and the St. Lawrence, with the exception of some occasional ridges, is nearly level, and, from the richness of its soil, is covered with populous and flourishing settlements.

Beyond this ridge, at the distance of about fifty miles, is another and a higher range, generally denominated the Land's Height, because it divides the tributary streams of the St Lawrence from those which flow towards the Atlantic Ocean; and its summit is also supposed to constitute the boundary line between the territories of Great Britain and the United States. This range of mountains commences near Cape Rosier, in the Gulf of St. Lawrence, and, stretching into the interior in a direction nearly parallel with the course of the river, and with the former chain, terminates on the eastern branch of the Connecticut river, being in length nearly 400 miles. The country lying between these two ridges varies in its quality and fertility, according to its peculiar situation. From the 45th degree of north latitude, which is the boundary line between Canada and the United States, to the river Chaudiere, within a few miles of Quebec, there is a tract of excellent and fertile land, divided mostly into townships, many of which are occupied and under cultivation. This part of the country, from its luxuriant soil, and from the great advantage of being contiguous to the United States, and also from containing the main roads and principal points of communication between the two territories, will probably become the most flourishing portion of the province. From the river Chaudiere eastward to Lake Temiscouata the land is broken, irregular, and of an indifferent quality, interspersed, however, with some good and productive tracts, of which the returns would amply repay the expenses of cultivation. From Lake Temiscouata eastward to Cape Rosier, in the Gulf of St. Lawrence, the country has been but partially explored. But it appears generally to be of a rugged and mountainous character; and such parts of it as are known present an appearance of sterility which holds out no encouragement to the labours of the farmer. On the banks of the St. Lawrence, however, some fertile spots are to be found, on which settlements might be established with advantage. On the south side of the ridge, down to the shores of Gaspé and Chaleurs Bay, the country is generally barren and mountainous, interspersed with occasional spots of excellent land, some of which, especially those on the shores of Chaleurs Bay, are well inhabited. They contain about 3000 inhabitants, most of whom, being employed in the fisheries, bestow comparatively little attention on agriculture.

That portion of Upper Canada which has been laid out into townships extends from the eastern frontier along the northern shore of the river St. Lawrence, Lake Ontario, Lake Erie, Lake St. Clair, and the communication between it and Lake Huron, in length about 570 miles; and its breadth towards the north varies from 40 to 50 miles. Throughout the whole of this tract the soil is excellent, and is not exceeded in fertility by any other part of the American continent. It generally consists of a fine dark loam, mixed with a rich vegetable mould; but it is so happily varied as to present situations adapted to every species of produce. For about 170 miles from

the eastern frontier of the province, to the head of the Bay of Quinté, on Lake On the land is spread out into an almost uniform level of great beauty, which rises a few feet from the bank of the St. Lawrence. It is well watered in almost e direction by numerous streams, which are generally navigable for boats and ca and which, at the same time, present the most desirable situations for the erecti machinery. From the Bay of Quinté, at the distance of about 40 miles from eastern shores of Lake Ontario, to its western extremity, runs a longitudinal r of no great elevation, and of inconsiderable breadth. Another ridge, called Queenstown Heights, extends from this point eastward along the southern shor Lake Ontario, between these and Lake Erie, into the State of New York. range never rises in any part more than 160 yards above the level of the lake country which lies between the two lakes of Ontario and Erie, and which ext round the western extremity of Lake Ontario to the Bay of Quinté, comprehen the Newcastle, the Home, and the Niagara districts, is watered by a number of l and small streams. The land throughout is uncommonly rich and fertile, and alr contains a number of flourishing settlements. A road leads from Toronto, near western extremity of Lake Ontario, and the capital of Upper Canada, to Lake Sim which is 40 miles long and 12 broad; and along this road a great number of emigr have been settled.

The remaining part of the tract we have been describing, which extends along northern shores of Lake Erie, from the river Ouse to the lake and river of St. C is an uninterrupted level, abounding in the most advantageous situations for se ments; and those portions of it which are already occupied and under tillage equal part of either province in the plentiful crops and thriving farms with which they abo That portion of the country which lies between Lake Erie and Lake St. Clair is haps the most delightful in the whole province. The fertility of the soil, the div fied and luxuriant scene which everywhere opens to the view, the excellent fish w abound in the rivers, and the profusion of game to be found in the woods, combir attract a continual supply of new settlers to this highly favoured tract.

Climate.—In Canada, the oppo-ite extremes of heat and cold are felt in all t excess. The greatest heat experienced during the summer is from 96° to 10 Fahrenheit in the shade; but the usual summer heat is about 80° or 82°. In wi the thermometer is sometimes 60° of Fahrenheit below the freezing point, alth it never continues above one or two days so low; and it is not above one twice in a season that this excessive cold is felt. In the winter of 1780 mercury was frozen at Quebec. The medium temperature of winter may be mated in general to be from 20° above to 25° below zero. The pure atmosphere cloudless sky which always accompany this intense frost make it both pleasant healthy, and render its effects on the human body much less severe than when atmosphere is loaded with vapours. In the vicinity of the sea, towards the eas coast of Lower Canada, fogs are frequently brought from the Gulf of St. Law by the easterly wind; but to the westward they seldom prevail, and even at Qu they are almost unknown. In Canada, the spring, summer, and autumn are com bended in five months, from May till September; the rest of the year may be to consist wholly of winter. In October frost begins to be felt, although during day the rays of the sun still keep the weather tolerably warm. In the succee month of November the frost increases in rigour, and one snow-storm succeeds other until the whole face of the country is covered, and the eye looks in vain for solitary spot of verdure whereon to rest. These storms are generally accompa by a violent wind, which, driving along the snow with immense velocity, ren them much more gloomy and terrific. The most severe snow-storms occur in vember, and generally come from the north-east, from the frozen regions of Hud Bay and Labrador. This gloomy and disagreeable weather frequently continues the middle or latter end of December, when the atmosphere clears; an intense then succeeds, the sky becomes serene, pure, and frosty, and of a bright azure and this cold and clear weather generally lasts till May. The snow covers the gro to the depth of several feet, so that wheel-carriages can no longer be used. T place is supplied by *carioles*, a sort of sledges, which, being placed on iron-runn resembling in form the irons of a pair of skaits, pass over the hardened snow with sinking deep. These carriages are generally light open vehicles, drawn by one ho to which the snow, after it is trodden for some time, and hardened by the frost, o very little resistance; and in them the Canadians travel in the most agreeable man and with inconceivable rapidity. So light is the draught, that the same horse go in one day eighty, and sometimes ninety miles; and the inhabitants of this

climate always take advantage of the winter, when they can trave. so easily and expeditiously, to visit their friends who live at a distance. Covered *carioles* are sometimes used to protect the travellers from the weather; but, in general, open carriages are preferred.

About the beginning of December all the small rivers are completely frozen over and covered with snow. Even the great river St. Lawrence is arrested in its course, and from the beginning of December till the middle of April the navigable communication is interrupted by the frost. During this period the river from Quebec to Kingston, and between the great lakes, except the Niagara falls and rapids, is wholly frozen over. The great lakes are never entirely covered with ice; but the ice usually shuts up all the bays and inlets, and extends many miles towards the centre of these inland seas. In Lake Superior, which is farthest to the north, the ice extends 70 miles from the shore. The river is seldom frozen over below Quebec; but the force of the tides is continually detaching the ice from its shores, and these immense masses are kept in such constant agitation that navigation is rendered quite impracticable. In some seasons, though rarely, the river is frozen completely over below Quebec; an event which happens when large masses of ice come in contact, and fill the whole space between the opposite banks, in consequence of which the whole becomes stationary. If this takes place at neap tides, and in calm weather, the intense frost gives it solidity before it can be deranged by the rising tides; and when it has stood for some days, it remains firm and immovable, till it is dissolved and broken up by the warmth of the April sun. When the river is frozen over, it is of great advantage both to the inhabitants of Quebec and to those of the adjacent country, as it affords an easy mode of transporting into the town all sorts of bulky commodities, such as fire-wood and other produce. It thus reduces the price of these necessary articles in Quebec, while, by diminishing the price of carriage, it opens to the produce of the most distant parts of the country a quick and easy access to all the most eligible markets.

The snow begins to melt in April, and the thaw is so rapid that it generally disappears by the end of the second or third week. Vegetation then resumes its suspended powers; the fields are clothed with verdure, and spring can scarcely be said to exist before summer arrives. In Upper Canada the winters are much shorter than in Lower Canada, and the cold is not so intense. The spring opens, and the labours of the farmer commence six weeks or two months earlier than in the neighbourhood of Quebec. The climate is not liable to the same extremes either of heat or cold, and the weather in autumn is usually favourable for securing all the late crops.

NATURAL PRODUCTIONS. — The greater portion of Canada is still covered with forests. The pine family and various species of evergreens are the predominant species; but there are also various other kinds, as the silver and American firs, Weymouth and Canadian pines, white cedar, maple, birch, ash, bass-wood, hickory, wild cherry, and numerous species of oak. From the sap of the maple, as it rises in spring, sugar is made in considerable quantity; the districts that produce it are called sugaries, and are considered a valuable kind of property. Most of the oaks are unfit for ship-building; but the species called the live-oak, which grows in the warmer part of the country, is said to be well adapted for this purpose. The various kinds of wood, which are available for no other purpose, serve to supply the pot and pearl ash manufactories. Tobacco, hemp, and flax, the different kinds of grain and pulse, are successfully cultivated; and likewise all the common fruits and vegetables of England. Melons of various kinds abound, and are probably native; also the strawberry and raspberry, the latter of which grows luxuriantly in the woods. Pears and apples succeed well, both at Quebec and Montreal; and, on the shores of Lake Erie, the grape, the peach, and the nectarine, as well as all the hardier kinds of fruit, arrive at the greatest perfection. Among the wild animals are the American elk, fallow-deer, bear, wolf, fox, wild cat, racoon, martin, otter, various species of the ferret and weazel, the beaver, hare, grey and red squirrel; and in the more southern parts, the buffalo and the roebuck. Bears usually hybernate, if the season has enabled them to acquire sufficient fat; if not, they travel southward. Beeves, sheep, swine, and other domestic animals, multiply with astonishing rapidity, and seem to improve by transportation to America. Among the birds may be noticed the wild pigeon, quail, partridge, grouse of various kinds, and numerous aquatic birds. One kind of humming-bird is indigenous, and may be seen in the Quebec gardens. Fish in great variety and abundance are found in the lakes and rivers; the sturgeon is common, and the salmon and herring fisheries are considerable; seals are also met with occasionally in large shoals, in the lower part of the St. Lawrence. Fish-oil is becoming an extensive article of export,

as well as hides and horns. The rattlesnake is also occasionally met wi
does not seem to be rich in minerals; but iron abounds in some distric
argentiferous lead have been met with at St. Paul's bay, 80 miles bel
and coals, salt, and sulphur, are known to exist in the country.

PEOPLE.—The greater part of the population of Lower Canada is of
gin; in 1831 the French inhabitants exceeded 400,000. They are frugal
dustrious, and hospitable; but cling tenaciously to old customs and preju
retain indeed all the characteristics of the old French, and present the sp
old, uneducated, stationary society, in the midst of a new and rapidly-adv
try. A few families possess large properties; but among the great mass of
as they are called, there is an almost uniform equality of condition, proper
rance. They are a hard-working people; and but very few of them can r
At the colleges and schools between 200 and 300 annually finish their ed
are dispersed throughout the community, chiefly as notaries and surgeons;
possess great influence over their uneducated neighbours; and generally tak
all public matters. The rest of the population is chiefly of British origin,
termixture of a few foreigners; and to them is owing the great develop
productive resources of the colony. Their number is constantly increasi
gration from Europe; in the nine years ending 1838, the number of
amounted to 263,089; but of these more than a half subsequently proc
United States. Native Indians still occupy portions of territory along
Huron and Superior, and along the whole extent of the northern bou
their number is rapidly diminishing; and little or no success has attended
efforts made to introduce civilization among them and to improve their c

About 1-38th part of the area of the province is estimated to be und
of cultivation, and is divided into townships, or signories. The latter wer
the French Government in favour of certain leading persons, who were bo
or 'concede' a portion to any applicant; the seigneur's profit being d
payment of a small rent, or from astricted services of the tenant; from
of the corn ground at the seignorial mill; and from a fine on the transfe
property otherwise than by inheritance. To this system it is owing that
population has been confined to a comparatively small extent of territo
never amalgamated with the British; for by its enabling every person
portion of land without any immediate outlay, young men were tempted
home; and being subject to feudal regulations and services, the occupiers
to a routine system of cultivation. Hence, the French Canadians exhibi
want of activity and enterprise; and their portion of the province has
poor population, strongly attached to ancient habits. Under British
methods of granting land have been practised; but it is now all disposed o
sales, at which the price is instantly payable.

With respect to religion, the French colonists are all Catholics; thei
numerous, and are under the spiritual jurisdiction of the Bishop of Quebec,
by Government. The Catholics have also a few female monastic establis
several public schools and colleges, where not only their clergy, but also
numbers of the *habitans* are educated. There is likewise an English Bisho
appointed by the Crown, with an archdeacon and clergymen in Lower Cana
archdeacons and forty clergymen in Upper Canada. Episcopacy, however
prevalent form of church government; there are a great many Protestant
who have places of worship and ministers in various parts of the province. T
of the Church of Scotland are paid partly by Government, and partly by t
gations; the other sects support their own clergy. The system, and t
elementary education throughout the colony are still very imperfect.
Catholics have several endowed academic seminaries; but there exists
college education for Protestants in Lower Canada, so that many young
nually drawn, for that purpose, into the United States; but in Upper C
is a college and royal grammar school at Toronto, with upwards of 100
college also for the education of ministers of the Church of Scotland is in
of being established at Kingston, under the patronage, and with the assist
General Assembly of the Church of Scotland; and, no doubt, the lite
of the institution will be made available for lay pupils.

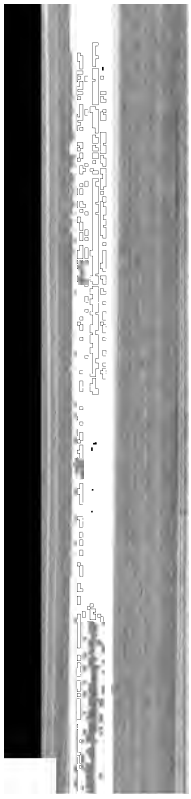
GOVERNMENT. — The government of both provinces is vested in a gov
ral appointed by the Crown, and assisted by a council. Formerly there
lative assembly for each province; but, by an act of the British parliament,
been united into one assembly, which meets at Kingston in Upper Canad

ministrative purposes the country is divided into districts, which are subdivided into counties, parishes, and townships. Each district has its own judges, subject to the general court of appeal; a sheriff, and a grand voyer, or inspector of the roads, whose duty it is to open new roads, and to see the established roads kept in repair. The legislative assembly has the exclusive right of raising money for the internal expenses of the colony.

COMMERCE.—The trade of Canada, from the period of its conquest by Great Britain, was regulated by the strict maxims of colonial monopoly. The St. Lawrence was rigidly closed against the entrance of all foreign vessels, nor was any Canadian vessel allowed to enter a foreign port. But the prosperity of the colony during its infancy was not materially obstructed by these restrictions, as the mother country offered at all times an ample and advantageous outlet for its surplus produce. After the United States achieved their independence, their vessels were excluded from the ports of the British colonies; and Canada was rewarded for its loyalty by the exclusive privilege of supplying the West India islands with lumber, and provisions, namely wheat, flour, biscuits, beef, pork, &c. In this manner, as the colony was originally injured for the supposed advantage of the mother country, one colony was by this enactment injured in order to benefit another. The neighbouring country of America is the natural resort of the West Indies for lumber and provisions. The voyage from New York or New Orleans to Jamaica is not more than 1000 or 600 miles, while from Quebec or Montreal the distance must be above 2000 miles; the freight of lumber and provisions, which forms a great part of the expense, must be greatly enhanced by the length of the voyage from Quebec, and still more if the articles are shipped from the United States to Canada, and thence re-shipped for the West Indies. The effect of this regulation therefore is greatly to raise the price of these necessary articles to the West India planter, to increase the expenses of sugar cultivation, and to lay the proprietors of Jamaica under contribution for the profit of the Canadian husbandman or wood-cutter. The annual expense of these restrictions to the West India planters is estimated by themselves at £1,392,353, which is, according to the same estimate, 5s. 6¾d. of additional cost on every hundredweight of sugar; and thus the wisdom of monopoly cannot compass, nor does it indeed aim at, any higher end than to benefit one part of the empire by injuring another. By 3 and 6 Geo. IV., these regulations were so far relaxed that the wheat and lumber of the United States were allowed to be imported directly into the West India islands on payment of certain duties; and an act which was passed in 1831 repealed all the import duties on provisions and lumber imported from the United States into the Canadas, and gave to these colonies all the advantages of a free trade. It does not appear, however, that the Canadas ever possessed a sufficient supply of lumber and provisions for the demands of the West India islands. The natural intercourse between the West Indies and the United States was indeed greatly interrupted by these restrictions, and the countervailing restrictions of the United States. Still considerable supplies have always been imported from the latter country. Of late years, indeed, owing partly to the retaliation of America, the trade was occasionally obstructed, and large supplies of lumber and provisions were received from Canada, to the benefit of the wood-cutters and husbandmen of that country, and to the proportional injury of the West India planter.

With a view also to the improvement of her colonies, the mother country consented to sacrifice an important branch of her own trade with the north of Europe. Her commerce with those countries, namely, Russia, Norway, Sweden, and Denmark, consisted in the exchange of her manufactures for their rude produce; and among her imports from Norway, Sweden, and the countries contiguous to the Baltic, timber was a staple article. The exchange was conducted on fair and liberal principles; it was mutually advantageous to both countries, and gave rise to an extensive and flourishing trade, which employed about 428,000 tons of British shipping. In 1809 the duties on timber imported from our North American colonies were entirely repealed; while the duties on timber imported from the north of Europe were largely increased, and, by successive additions, were raised to £3: 5s. per load. The repeal of this duty greatly augmented the importation of Canadian timber, and the general trade of the colony with great Britain.

But this extension of the colonial trade was purchased by the sacrifice of the timber trade with the north of Europe, which now almost entirely ceased, under the withering influence of prohibitory duties. Canada profited exactly in proportion as Great Britain was injured. For the supposed benefit of the colony, the mother country was compelled to buy the inferior timber of a distant province at a high price,



the colony advances in population and in wealth, cultivation is s
wastes; there is a great demand for labour, and ample means for
classes of the community enjoy ease and comfort. But there wou
labour, nor any high wages, unless the fund for paying these wa
procured; for no one would seek to purchase if he had not the
price; and hence it is evident that agriculture, by providing the fu
labour, namely, a surplus supply of subsistence, is the spring of all
that, the more abundantly its produce increases, the greater wil
inhabitants, and the more rapidly will the colony advance in wealt
this view, then, the undue encouragement given by the British
wood trade of the Canadas, by diverting the industry of the co
ture to less beneficial objects, is calculated to retard the growth
to render it less rich and populous than it would have been un
liberal policy. The clearing of the country is not aided, as mi
posed, by the efforts of the Canadian wood-cutter or lumberer. I
and the finest trees which he selects, and not one in a thousand i
to his purpose; while it is the practice of the farmer who clears t
tion to consume all the trees on the spot. The author of the *Sk*
Upper Canada (the Backwoodsman), though he argues strongl
existing monopoly, states, among the other pernicious effects of
draws the cultivators from their legitimate occupations, and make
certainty of earning a competence by a steady perseverance in the
suits, for a vision of wealth never to be realised." Mr. Macgrego
able work on the British colonies, though he is decidedly in favou
portation of timber from Canada, observes that "the trees cut d
of commerce are not of the smallest importance in respect to cle
though I have heard it urged in England as an argument in fav
trade." In another part of his work, which treats of Prince Edwa
serves: "The timber trade has been for many years of some i
ploying a number of ships and men; but as regards the prosperit
must be considered rather as an impediment to its improvement
by diverting the inhabitants from agriculture, demoralizing their h
enabling them to procure ardent spirits with little difficulty, whic
stances has led to drunkenness, poverty, and loss of health." It is
that in all cases where the new settlers have been diverted from
timber trade, the fisheries, or any other object, the progress of t
retarded, just as the Portuguese and Spanish colonies in Brazil a
poverished by the mining speculations of the early settlers. Agri

at this season is extremely cold, yet he is day after day wet up to the middle, from the time that the floating commences till the timber is delivered to the merchants, which seldom occupies less than a month or six weeks. This constant immersion of the body in snow-water undermines the constitution, occasions severe rheumatism and other disorders, and at last brings on general debility and premature old age. In no view, therefore, in which it can be considered is this trade deserving of any special favour.

Furs have been a staple article of the Canadian trade from the first settlement of the colony. These were originally procured from the Indians by the *coureurs des bois*, who penetrated into the remote wilds of the interior, in exchange for shot, brandy, red cloths, knives, hatchets, trinkets, and a few other articles of European manufacture, and were brought to Three Rivers and Montreal. The French afterwards carried on the trade by means of licences granted to a limited number of gentlemen and old officers, any interference with whose privileges was forbidden on pain of death. From twenty to thirty canoes, each carrying from six to seven men, were employed in procuring supplies; and they were usually accompanied in their return by fifty or more canoes of Hurons and Ottawais, who descended to Montreal, for the purpose of selling their cargoes to more advantage than at Michilimakinnak. The fur traders are exposed to many perils and hardships. It is only in bleak, wild, and snowy deserts, which abound in animals requiring a thick covering to protect them from the inclemency of the seasons, that furs of any value are to be found; and the trader has to brave the dangers of savage tribes, inland seas, deep and trackless forests, cataracts, and rapids. He has to make his way through the ice and the snows of winter, and amid every species of annoyance in summer from the attacks of mosquitoes and other varieties of tormenting insects. All these hardships, however, are voluntarily endured by private adventurers, by whom, after the conquest of Canada, the fur trade was carried on, aided by the *coureurs des bois*. Among these rude adventurers in the interior of the desert, and beyond the reach of legal authority, jealousies and quarrels, followed by scenes of violence, frequently took place, till they were at length associated, by the exertions of the late Sir Alexander Mackenzie, and formed into the famous North West Fur Company of Montreal. By this company the fur trade has been prosecuted with extraordinary vigour; and a spirit of enterprise has been infused into its numerous servants, under the influence of which they have surmounted fatigue and danger, and penetrated into the remotest extremities of the continent. The American expedition of Captains Lewis and Clerk, who ascended the Mississippi, and, crossing the Rocky Mountains, penetrated to the Pacific Ocean, has been already fully detailed by these enterprising travellers. Since this period the bold adventurers of the North West Company, eagerly embracing every opportunity to extend their trade, have established a line of stations or forts from Canada to the mouth of the Columbia river on the Pacific Ocean. There is from Canada, in a north-west direction, an imperfect water communication for about 1590 miles into the American wilderness to Cumberland House, a fort and storehouse of the North West Company. This communication is carried on from the St. Lawrence, through the great Lakes Erie, Huron, Superior, the Lake of the Woods, Winnipeg Lake, and by intermediate rivers, occasionally interrupted by rapids, through which the light craft employed in the service are pushed by the unrivalled skill and courage of the Canadian boatmen, and by cataracts, past which the boats must be carried for several miles. At Cumberland House the river Athapescow, descending from the Rocky Mountains, runs into one of this series of lakes. This river is ascended to its source in small boats; and a land journey across the great mountain barrier which separates the streams that flow westward into the Pacific from those that flow eastward into the Atlantic Ocean, brings the travellers to the sources of the Columbia, on which they embark, and descend the stream to its mouth in the Pacific Ocean. In this perilous journey, of from 4000 to 5000 miles, they are exposed to many accidents in travelling between the distant stations of the company, and frequently encounter the hostility of the savage tribes scattered over the desert. Courage, calmness, and presence of mind, are qualities which are greatly in request among the traders. They always carry with them the formidable rifle, with which they take a certain and deadly aim, depending on it as they do both for safety and for food. They are thus equally prepared to trade or to fight with their savage customers, and to pay them for their furs either in gold or lead. After Lord Selkirk established his colony on Red River, to which, from the beginning, the North West Company showed an inveterate hostility, long, obstinate, and bloody contests took place between these rival traders. Regular hostilities were carried on, lives were lost and prisoners taken; and

in one encounter in the desert, far beyond the limits of legal authority twenty or thirty of Lord Selkirk's men lost their lives. This violent o was terminated in 1821, by the coalition of the rival companies, namely, son's Bay and the North West Company.

The foreign trade of Canada is carried on through the ports of Quebec, St. John's, Coteau-du-lac, and Stanfield. The principal articles of export timber and ashes; the imports are coal, metals, cordage, East India produce, ous kinds of British manufacture from Europe; sugar, molasses, rum, coffee, woods from the British West Indies; with beef, pork, biscuit, rice, and toba the United States The total value of the imports for the year 1836, was £1, and that of the exports, £1,034,514. There are small manufactories of differen at Montreal and Quebec; and soap and candles are now exported. A cloth tory has been established in the township of Ascot; the number of looms Canada is supposed to be about 13,500, which produce annually 1,500,000 coarse cloth, 900,000 yards of flannel, and 1,370,000 yards of linen. Iron-w carried on to a very great extent at St. Maurice, in the district of Three there is one iron-foundry in the district of Quebec, and six in that of Montr

INTERNAL COMMUNICATIONS.—The roads are generally very bad, and the communication very incomplete. The St. Lawrence, however, and the lak the most ample means of transport during summer, when they are clear of in winter, travelling is performed in sledges, which pass with great expedit the frozen snow. The falls and rapids of the St. Lawrence have been avoided cuts (See *anté*, RIVERS); but, to make the communication more complete and two extensive lines of inland navigation have been executed. The *Rideau C* tends from Bytown, on the Ottawa, to Kingston, on Lake Erie, a distanc miles, of which, however, only 20 consist of excavation, the rest being natur nels or slack water produced by dams. It has been executed at the expens British Government, and cost little less than £1,000,000 sterling. The *Canal* extends from the south-western part of Lake Ontario to Port Matl Lake Erie, a distance of 42 miles. By means of the latter the insuperable Niagara are avoided. The communication is large enough for vessels of 125 t has been executed by a public company, at the cost of more than £500,000.

DIVISIONS.—As already mentioned, Canada is divided into two provinces Upper and Lower. Lower Canada is divided into the four districts of *Montreal*, *Three Rivers*, and *Gaspé*; Upper Canada is divided into eleven named *Home*, *Gore*, *Niagara*, *London*, *Western*, *Eastern*, *Johnston*, *Ottawa*, *B Newcastle*, *Midland*. These are subdivided into counties, the areas and popul which, as in 1840, are stated in the following tables: —

I. UPPER CANADA.

The counties marked *a* extend indefinitely north, but, except near the river, are almost unfit for settlement.

In Upper Canada, the unsettled territory consists of about 120,000 square miles, and in Lower Canada, of 7174; the total area of both provinces is about 355,000 square English miles.

Cities and Towns.

QUEBEC, the capital of Lower Canada, is situate partly on a bold headland rising 350 feet above the left bank of the St. Lawrence, between it and the River St. Charles, and partly on the narrow margin of the river, below the rock. The principal part of the upper town is inclosed with fortifications which are considered to be impregnable, and the summit of Cape Diamond is crowned by the citadel, a very strong fortress. Population in 1840, 25,916. The Hotel Dieu, or General Hospital, the Roman Catholic and Protestant Episcopal Cathedrals, the Jesuits Barracks, the Parliament House, and the obelisk erected to the memory of Wolf and Montcalm, are the principal objects of interest. Quebec is situate in N. lat. 46° 48′, and W. long. 70° 72′, 420 miles from the Gulf of St. Lawrence; and is accessible to the largest ships. *Montreal*, situate on an island of the same name, at the mouth of the Ottawa, is prettily placed at the foot of a hill which commands a delightful prospect. Population in 1840, 27,297. It is accessible for large ships, though 600 miles from the Gulf, and its trade is very extensive. The Roman Catholic Cathedral is a very fine building, capable of containing 12,000 people; and some of the convents and hospitals are striking objects. The island is a beautiful oval-shaped tract, 32 miles long, by 10 broad, with an almost level surface, there being only one hill of considerable elevation, and one or two of smaller dimensions. It forms one seignory belonging to the Catholic clergy. *Lachine*, a village nine miles above Montreal, owes its prosperity to the rapids below, which have made it the landing and shipping place for goods passing between Montreal and the upper country; some part of the trade, however, is carried past it by boats through the Lachine Canal. *Coteau-du-lac*, at the foot of Lake St. Francis, and above the Cedar rapids, owes its rise to similar circumstances. *La Prairie*, on the south side of the St. Lawrence, a few miles above Montreal, is the great thoroughfare of traffic between that city and the United States. A railroad, 15 miles in length, connects it with St. John, on the Richelieu, at the foot of the navigation for lake vessels. At *Chambly*, below St. John, there is a strong British military post. *Sorel* or *William-Henry*, at the mouth of the Richelieu, is a less considerable town than might be expected in such a situation. Its population is only 2000. There are a military post and garrison on *Isle aux Noix*, above St. John. The banks of the river between Montreal and Quebec, are lined with numerous pretty villages, which are rendered conspicuous by their large stone churches, with shining tin-covered roofs and spires. But there is no place of much importance except the town of *Three Rivers*, at the mouth of the St. Maurice, on its left bank, which is a place of some trade and mechanical industry, and has a population of 4000. Below Quebec the settlements are few, and consist generally of fishing villages. In the Saguenay country, and the Domain, the only white occupants are found at the trading stations of the King's Posts Company, which possesses the exclusive privilege of taking furs and fish in this quarter. *Stanstead*, with 1200 inhabitants, and *Sherbrooke*, with 800, are the principal towns of the *Eastern Townships*, a tract of 6,000,000 acres, behind the French seignorial settlements, on the borders of New Hampshire and Vermont; and which, during the last few years, have been colonized by upwards of 50,000 British and American immigrants. There are also some thriving little towns on the left bank of the Ottawa, in Lower Canada, where the lumber trade is actively carried on. *Hull*, opposite Bytown, with which it is connected by a chain of remarkable bridges across the falls, is the principal; its population is about 1500.

TORONTO (late YORK) the capital of Upper Canada, contains about 12,000 inhabitants, and occupies a good situation on a fine bay of Lake Ontario, which affords access to vessels drawing 15 feet water, and is sheltered by a low, circular, sandy, peninsula opposite the town. *Kingston*, with 5000 inhabitants, is very advantageously situate at the head of the Cataraqui river, and of the Rideau canal, on the site of the old French fort *Frontenac*. The harbour is well sheltered, convenient, and accessible to ships of 18 feet draught, and contains the royal naval station on the lake. The entrance is strongly fortified. *Port Hope* and *Cobourg* are thriving towns between Toronto and Kingston, but occupy exposed situations on the shore of the lake. *Brockville*, *Prescott*, and *Cornwall*, are considerable towns on the St. Lawrence, with populations of from 1200 to 1500. Prescott is situate at the foot of the navigation for large vessels and steamers; but small steamers ply in the river between it and Coteau-du-lac, passing the Long-Sault rapids above Cornwall by means of a canal. *Bytown*, at the mouth of the Rideau river, on the right bank of the Ottawa, is a thriving town with 1500 inhabitants.

Perth is an increasing town, about midway between the Ottawa and Lake Ontario, and is c with the Rideau canal by a lateral cut of 11 miles. *Hamilton*, at the head of Lake Ontario, l risen into importance, in consequence of the rapid occupation of the fertile country to the w At the mouth of the Niagara is the town of *Niagara*, formerly called *Newark*, which ha harbour and an active trade, though the Welland canal diverts some of its business. *Qu* stands on the Niagara, at the foot of the ridge through which the river has cut its deep Here a battle was fought in 1812, and a monumental pillar subsequently erected to the memo British general Brock, who fell in the action; but some miscreant has lately almost destro blowing out its inside with gunpowder. The other principal places worthy of notice in U nada, are: *Chippeway*, a village above the falls; *Fort Erie*, opposite Buffalo; *Sherbrooke*, at t of the Ouse, on lake Erie; *Victoria*, *Charlotteville*, and *Fort Norfolk*, on or near the bay form Long Point in Lake Erie; *Amherstburg*, at the mouth of the Detroit, with a good harbour litary post; *Sandwich*, opposite the city of Detroit; *Goderich*, on the eastern coast of Lak *Chatham* and *London*, on the river Thames, which flows through a very fertile country into Clair; and *Guelph*, 45 miles W. of Toronto. There is also a fort, garrison, and naval st *Penetanguishene*, on Gloster bay, at the south-east extremity of the Georgian bay of Lake Hu

§ 2. *New Brunswick.*

This province consists of a compact territory of 27,700 square miles; bounded on the nort Bay of Chaleurs and the river Restigouche: on the south by the Bay of Fundy; on the eas Gulf of St. Lawrence; and on the west by Lower Canada and the State of Maine. The fa country is in general pretty level, or moderately undulating, but it is diversified by several groups of hills, particularly in the northern part. It is profusely watered by rivers, which f form fine navigable streams. The province is divided into ten counties, which are subdivi townships. The population, amounting to about 130,000, is chiefly concentrated on the Fundy, the lower part of St. John's river, and the section between it and the St. Croix. Th fish are the staple articles of export; to which may be added some ashes and agricultural The total value of the exports is about £400,000; that of the imports, £600,000. *Fredericton*, th is situate at the head of sloop navigation on the St. John's, 85 miles from the sea. Populat *St. Andrews*, on Passamaquoddy bay, is favourably situated for trade, and contains about 5 bitants. The city of *St. John's*, at the mouth of the river, contains about 8000 inhabitants. *N* and *Chatham*, on the *Miramichi* river, will probably become important centres of trade, w country in the interior is more fully occupied. *Dalhousie*, a rising town at the western extr the fine *Bay of Chaleurs*. *Bathurst*, on a bay of the same name, on the south side of the Bay lours. *Liverpool*, on *Richibucto harbour*, on the east coast.

§ 3. *Nova Scotia and Cape Breton.*

This province comprises the peninsula of Nova Scotia and the island of Cape Breton, separated from the north-east coast of the mainland by the narrow Gut of Canso. The isthmu connects Nova Scotia with New Brunswick between Chignecto Bay and Bay Verte is only across. Including both portions, the area of the province is about 17,500 square miles, of whi a fourth belongs to the island. The surface is in general moderately undulating, and con considerable elevation. The southern shore of the Bay of Fundy from Cape Blomidon to Briar is lined by a lofty mural precipice of trap rocks, from 300 to 600 feet high, against which the in tides and waves of the bay dash with great violence. This dyke is broken through in severa which afford by the Annapolis Gut access into the interior. The Highlands of the south-we the peninsula have not been explored. Nova Scotia has been unfavourably represented as a h foggy region; but the summer fogs which prevail on the southern and south-western shore extend far inland. Although the winters are long and cold, yet they are not more so than in jacent parts of New England, and the climate is remarkably healthy. The soil is well ad agriculture; and the cultivated portion chiefly on the southern shore, which contains about a f of the surface. The mineral wealth of the province is uncommonly great; but hitherto it h turned to little account. The Cumberland, Pictou, and Sydney coal beds, the magnetic iro Annapolis county, and the bog iron ore of various places, granite and freestone of excellent qu building materials, the latter affording the blue grits so much esteemed in the United S grindstones, and the former, excellent millstones; writing and roofing slates gypsum and lime copper, copperas ore, alum earth; pipe clay; red and yellow ochres; and salt, are enumerate its minerals. About 100,000 tons of gypsum are annually exported for the United States; and a quantities of coal from the Pictou and Sydney beds. The population of the province is about 2 is composed of a small number of Acadian French, the descendants of American loyalists and emigrants, and of British emigrants. The principal trade of Nova Scotia is with the We Britain, and the United States. Lumber, fish oil, furs, &c. are exported to Britain; lumbe and pickled fish, flour, salt provisions, cattle, &c. to the West Indies and the southern Stat and gypsum to the northern and middle States. *Halifax*, the capital, is a large town with 1 habitants, pleasantly situate on an inlet of the sea, which forms one of the finest harbour world. It is easily accessible, and large enough to accommodate any number of vessels. Halif principal British naval station in North America, and contains a royal dockyard on an e scale. On the coast south-west of Halifax are *Lunenburg* and *Liverpool*, important from t harbours, fishery, and flourishing trade. They have each a population of 2000. *Shelburne*, ther south, once contained about 12,000 inhabitants, but is now almost deserted, though sit one of the best harbours in the world. *Yarmouth*, on the south-west coast, is noted for th prise of its inhabitants, who carry on an active coasting trade, and a thriving traffic with and the West Indies. *Windsor*, on the Mines basin, is the seat of King's College. *Pictou*, fine harbour of that name, is the principal town on the north-east coast; its population is abo and its fishery and lumber trade are considerable. The village of *New Glasgow*, on East ri risen with the coal trade, and small vessels are loaded there; but larger shi, s receive their ca the mouth of the river, to which the coal is carried down in lighters. Eight miles off the m the harbour, is the small island of *Pictou*. *Guysboro*, on Milford haven, at the head of t expanse called *Chedabucto Bay*; *Wilmot* on *Canso Harbour*; and *Sherbrooke* at the head of t gation on St. Mary's River, are small towns north-east of Halifax.

Cape Breton Island comprehends an area of about 2,000,000 acres, and is almost divided i parts by a deep gulf named the Bras d'or, which has two very narrow entrances from the Gu Lawrence on the north-east, and approaches at the south-west to within a mile of the Gut of It affords several deep and capacious harbours, and is valuable for its fisheries. Coal, salt, and are found here. The principal coal field lies between Miray Bay and Sydney harbour, and c the Sydney and Bridgeport mines, from which increasing quantities are annually shipped. *Sy* Spanish River or Sydney harbour, on the north-east side of the island, is the principal town only military post. Its population is about 1000, and its trade and fisheries are extensive. T

bour is one of the most secure and capacious in North America. *Louisbourg*, on the southern shore, so famous in colonial history, is now occupied by a few fishermen. *Arichat*, on Isle Madame, at the southern extremity of Cape Breton, is a large fishing village, with a pretty extensive trade. To the north of Cape Breton is the little island of *St. Paul*, directly in the track of vessels entering the Gulf of St. Lawrence. It has long been dreaded by seamen, on account of the dense fogs which prevail there, and the deep water almost close to its shores; but a lighthouse has recently been erected on it, which tends to diminish its dangers and terrors.

§ 4. *Honduras.*

Honduras is situate on the eastern coast of Central America, between 16° and 18° N. lat. and 88° and 90° W. long, and contains an area of 62,740 square miles. The coast is flat, and is bordered with reefs and low green islands called *keys*, which are divided by intricate and dangerous channels. From the coast the ground rises gradually into an elevated region covered with forests and marshes, and interspersed with rivers and lagoons. The climate is moist, but is said to be less unhealthy than that of the West Indies, especially during the wet season. The average annual temperature is 80°; but, during the greater part of the year, the heat is moderated by sea breezes. The rains are very heavy, and are accompanied by violent thunder storms; and during the wet season, which lasts five months, the thermometer sinks to 60°. The shores and river banks are covered with a deep and rich alluvial soil, capable of yielding most European as well as tropical products. The forests abound with some of the finest timber trees, including mahogany and logwood, which are the staple productions of the settlement, and the cutting of which is the principal employment of the settlers. The profits, however, of the Mahogany trade are very precarious. Logwood cutting is much less expensive; but the price fluctuates even more than that of mahogany, varying from £7 to £14 a ton. Cassava, yams, arrow-root, and maize are grown, but only for home consumption; the sugar-cane, cotton, and coffee, succeed well, but are little cultivated; cocoa and an inferior kind of indigo are indigenous. Oranges, and many other fine fruits are very abundant. European cattle and other domestic animals thrive greatly. The jaguar, tapir, armadillo, racoon, grey fox, deer of various kinds, and a vast number of monkeys abound in the settlement; birds and fish are in great variety, and shell-fish are particularly plentiful. Many turtles are also taken on the coasts and sent even to London. Honduras is governed by a superintendent nominated by the Crown, and by seven magistrates elected annually by the people, who together form a council. The only town is *Balize* (the Spanish form of *Wallis*, the name of a noted buccaneer), at the mouth of the river of the same name, which consists of about 500 houses, chiefly wooden, and elevated only ten feet from the ground. The total population of the settlement scarcely exceeds 4000, of whom only 300 are whites.

STATISTICAL TABLE OF THE SETTLED BRITISH PROVINCES IN NORTH AMERICA.

Name.	*Date of Settlement or Acquisition.*	*Area in Square Miles.*	*Population.*	*Capitals.*

III. THE UNITED STATES
OF NORTH AMERICA.

SITUATION, EXTENT, BOUNDARIES. — The United States of North America are bounded on the north by the Russian and British provinces; on the east by New Brunswick and the Atlantic Ocean; on the south by the Gulf of Mexico, Texas, Mexico, and California; and on the west by the same states and the Pacific Ocean. By treaty with Spain in 1819, and with Mexico in 1828, the boundary line, beginning at the mouth of the Sabine, runs north, along the western bank of that river, to 32° N. lat.; thence due north to the Red River, and westward along that river to 100° W. long.; from this point it extends north to the Arkansas, whose course it follows along the southern bank, to its source in lat. 42° N., from which it runs due west on that parallel to the Pacific Ocean. All the islands in the limitary rivers belong to the United States; but the navigation is free and common to the citizens of the contracting countries. By treaty with Russia, in 1824, it was stipulated that that power should form no settlements south of 54° 40′ N. lat.; but the tract lying beyond the Rocky mountains, between the Mexican and the Russian territories, is claimed by the British Government, whose subjects have advanced their settlements to the Columbia River.

By the treaty of 1783, with Great Britain, the eastern boundary was fixed at the river St. Croix, from its mouth to its source, and a line drawn thence due north to the highlands which divide the waters of the Atlantic from those of the St. Lawrence. The position of the dividing ridge, which was to form the northern boundary in this quarter, is still a subject of dispute. Following that ridge, wherever it may be, to the north-western head of the river Connecticut, the boundary line then passes down the middle of that river to lat. 45°, westward on that parallel to the St. Lawrence, and then through that river and the great lakes to the north-western corner of the Lake of the Woods. From this point it was stipulated that the line should run due west to the Mississippi; but as it was afterwards discovered that the Mississippi did not reach so far north, and, as the acquisition of Louisiana by the United States had left unsettled the northern boundary west of that point, it was stipulated, that from the north-western corner of the Lake of the Woods, it should run due north to the parallel of 49°, and thence westward along that parallel to the Rocky Mountains. Beyond these, the boundary is still unsettled, both Governments claiming the whole Oregon territory along the Pacific between 42° and 54° N. lat.

The whole of the vast region included within the boundaries above specified, contains an area of about 2,300,000 square miles, with a frontier line of 10,000 miles, of which about 3600 are sea-coast, and 1200 lake-coast. A line drawn across the continent from the Pacific Ocean to the Atlantic, near the middle of the States, is about 2500 miles in length; and the greatest breadth, from north to south, is nearly 1400 miles. But the portion of country comprised within the limits of the actually organized States and territories, is bounded by a line running north from the Sabine to the Missouri, and following the latter to the mouth of the White-earth-river, and may be estimated to contain about 1,300,000 square miles. An almost straight line, however, drawn from the river Des Moines to Green Bay, but curving a little to the north-west, would mark the actual limits of occupancy, thus excluding about 270,000 square miles, still owned and inhabited by Indian tribes east of the Missouri.

GENERAL ASPECT.—Three great systems of mountains (See *ante*, p. 875) divide the country into three distinctly marked sections, the Atlantic table-land and slope, the Mississippi valley, and the Pacific section. The Alleghany or Appalachian mountains, which separate the first two sections, are more remarkable for their length than for their height. The mean elevation of the chain is not more than 2000 or 3000 feet, of which one half consists of the elevation of the country which forms their basis. Between the sources of the principal rivers of Alabama and Mississippi, and the great lakes and the St. Lawrence, and about midway between the Atlantic and the Mississippi, lies a vast table-land, which occupies the western part of the Atlantic States and the eastern part of the adjoining states of the Mississippi valley. On this table-land, which carries a somewhat tempered northern climate into the region south of the river Tennessee, rise five or six parallel mountain chains, of which the most remarkable are the *Blue Bridge* in Virginia, the *Kittatinny* mountains, and the *Alleghany* ridge, both in Pennsylvania. The highest range of the Alleghanies is found in New Hampshire,

under the name of the *White Mountains*, so called from the greyish-white colour of the bare rocks that form their summits. *Mount Washington*, the highest point, rises to the elevation of 6234 feet, and there are several others, which exceed 4000 and 5000 feet (See *ante*, p. 875). In Vermont, the ranges take the name of the *Green Mountains*, from their summits being covered with a spongy green moss and their sides with forests; their elevation, however, does not exceed 3500 feet.

The second mountain system, which forms the western boundary of the Mississippi valley, and is known under the various names of *Rocky*, *Stony*, *Oregon*, and *Chippewyan* mountains, is a prolongation of the cordilleras of Mexico; but it has been only partially examined. The average elevation of the summits above the base is estimated at 5000 feet; but some of them probably reach 8000 or 10,000. The elevation of the base itself is about 3000 feet above the level of the sea. The *Black Hills*, which stretch between the Upper Platte and the Missouri, below the mouth of the Yellowstone, are probably an outlying chain of this system; but little is known of their course and elevation. The *Ozark* mountains extend from the Rio del Norte to the vicinity of the Missouri, below the Osage river, attaining in some places an elevation of 3000 feet. Farther west is the prolongation of the snowy range of the mountains on the Pacific coast, which stretches northward from California to Alashka.

Along the whole Atlantic coast of the United States, from the river Hudson to the Florida channel, and gradually widening from a few miles broad in the north, to upwards of 150 in the south, is an extensive level tract very little elevated above the surface of the sea, and which has been appropriately termed the Atlantic Plain. The western limit of the plain is very distinctly marked by a rocky ledge over which the rivers fall, and to the foot of which, in the northern section, the tide penetrates. Extensive morasses and swamps, sluggish streams, and wide arms of the sea stretching far inland, are among the features of this plain, which slopes gently eastward, and may be considered as continued under the sea from the soundings which are given by all this part of the coast. The irregularities of its surface have been caused rather by the excavations which have been made below the general level by the action of running water than by any considerable elevations above it. The table-land which rises along the western border of this plain, has a general elevation of from 800 to 1200 feet, but is in some places considerably higher. A similar, but more elevated table-land lies between the heads of the Platte, Arkansas, and Missouri, and the western littoral chain of mountains; and between these two table-lands, and the mountains which rise above them, lies the great Mississippi valley, which presents the appearance of having once been the bed of a sea, or of a series of fresh-water lakes, and to have emerged from the waters at a comparatively recent period. It is in general characterized by uncommon fertility, though it contains great diversities of soil, from the richest alluvium to the most sterile flint knobs; and from the most entangled cane brakes to the poorest pine hills. There are, besides, near the Rocky Mountains, wide sandy belts, either completely barren, or only covered with a scanty vegetation of weeds and coarse grass. In some parts indeed there are wastes of moving sand, like those of the African Sahara. The eastern portions of the valley, where it is yet uncultivated, are covered with forests; but to the westward and northward extend vast *prairies*, or undulating tracts of country clear of trees, and rising to a considerable elevation in the centre. The surface of prairie, for 100 leagues west of the Mississippi, is probably, in comparison with the wooded country, in the proportion of twenty to one; the little timber which is seen occurs only on the skirts of the water-courses; and as the traveller recedes from the margins of the rivers, the prairies become more dry, sterile, and destitute not only of wood and water, but of all vegetation. The middle part of this great valley forms a plain, the elevation of which throughout its whole extent, leaving out of view a few unimportant local inequalities, varies only a few feet. There is, however, a gradual declination from the north-east towards the south-west. From Pittsburg the Ohio river has a descent of only 700 feet to its mouth, a distance of 1100 miles. The plains of Kentucky and West Tennessee are nearly on the same level as the country around Pittsburg, and proceeding westward, up the Missouri or Arkansas, we reach similar elevations, which form the exterior limits of the plain. The numerous rivers that run through it, instead of forming separate valleys, only indent narrow lines or grooves in its surface, which are barely sufficient to contain their floods. These river channels, as the current rolls on, must form a declivity; and towards the lower parts they therefore sink deep into the plain. Hence the large rivers, Ohio, Missouri, and others, seem to be bordered with abrupt hills of several hundred feet in elevation; but the tops of these hills are on the level of the great plain, and are formed by smaller streams which fall into the large rivers, where their channels are thus worn down. The plain rests on an

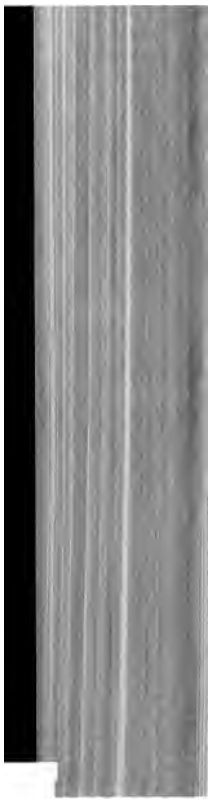
almost horizontal bed of limestone, of such thickness that it has never been pier through, although, in many places, the auger has penetrated from 400 to 600 f in search of salt water. The rock lies but a few feet below the surface, and supp throughout its whole extent strata of bituminous coal, and saline impregnations. the decomposition of this limestone may be attributed, in part, the fertility of the s while its absorbent and cavernous character prevents the accumulation of swa and standing pools, and renders the whole plain dry and salubrious in a remark degree.

CLIMATE. — The climate of the United States embraces every variety of tem rature, from the cold sea air of Passamaquoddy to the dry, elastic, and severe t perature of the White and the Green Mountains; rising through all the degree the thermometer to the climate congenial to the olive, the sugar cane, and the ora It is, however, excessive, and subject to great and rapid changes. Captain Sm in his account of the Chesapeake Bay, presented to Queen Anne, says, that in country the summer is as hot as in Spain, while the winter is as cold as in Franc England; and Mr. Jefferson, in his "Notes on Virginia," says, "The extreme heat and cold, of 6° below zero, and 98° above it, are distressing." He adds, in 1780 the Chesapeake Bay was frozen from its head to the mouth of the Potom and at Annapolis, where it is 5½ miles between the nearest points of land, the was from five to seven inches thick, so that loaded waggons crossed over. Se colds, rheumatisms, intermittent fevers, and agues are the natural consequence such extremes as these. On this account the climate will not allow the inhabit to take the exercise necessary for health, without running great risks, and very o contracting colds and chills, which end in consumption. The climate on the coasts of the Eastern States, from Maine to Baltimore, is the worst of all, becaus addition to the sudden changes, cold and damp easterly winds prevail, and occasi great deal of disease. The Americans, however, are fond of their climate, and sider it the best in the world. But, if the climate is not healthy, it is certa beautiful to the eye; the sky is so clear, the atmosphere so dry, the tints of the foli so inexpressibly lovely in autumn and the early winter months; and at night stars are so brilliant, that it is not surprising the Americans should praise it, and proud of its apparent superiority. The climate of Britain, though unprepossessin the eye, and depressing to the spirits, is nevertheless much more healthy than exciting and changeable, though beautiful, atmosphere of the United States. though in the eastern states consumption is very prevalent, in the western regions disease is scarcely known. The American diseases generally are neuralgic, or those affect the nerves, and are common to almost all the Union. Ophthalmia, and p cularly the disease of the optic nerve, is very common in the eastern states, and t are annually more diseases of the eye in New York city alone than are perhaps to all over Europe. The tic doloreux is another common complaint over all Am indeed so common, that one out of ten suffers from it more or less, the majority b women. In short the climate is one of extreme excitement, and the American p are in consequence more excitable, and more rapid in muscular movement than European stocks from which they are descended. The winters of Wisconsin, Iow Missouri, and Upper Canada, are dry and healthy, enabling the people to take any portion of exercise. Michigan, Indiana, Illinois, and part of Ohio, are very unhea in autumn, from the want of drainage; the bilious congestive fever, ague, and dy tery, carry off large numbers of people. Virginia, Kentucky, North Carolina, and eastern parts of Tennessee, are comparatively healthy. South Carolina and the o southern states are subject to visitations of the yellow fever, and many of the i bitants consequently migrate at the end of each season to the northward, not onl avoid the contagion, but also to renovate their general health, which suffers from continual demands made by the climate on their physical energies; the atmosphe the western and southern country being even more exciting than that of the e Vermont, New Hampshire, the inner part of New York, and all the other States border on the great lakes, are healthy, owing to the dryness of the atmosphere is modified by the proximity of so large bodies of water. The excitement which vails throughout the Union, and forms so remarkable a feature in the Amer character, is occasioned much more by climate than by any other cause; thou unquestionably, the peculiarity of the national institutions affords constant alim for this excitement to feed on, and therefore seldom allows it to repose. The mate seems also to be, in some degree at least, the cause of two bad habits to wh the Americans are much addicted, namely, the use of tobacco, and of spiritu liquors. The effect of tobacco is narcotic and anti-nervous; it allays irritation

enables the American to indulge in stimulating habits, without the accompaniment of their immediate evil consequences. To the rapid changes of the climate, and to the extreme heat of summer, must also in a great degree be ascribed the excessive use of spirituous liquors. The system, depressed or disordered by the sudden changes, requires stimulants to equalize the pulse. The variableness, however, of the climate, says Mr. Flint, has been generally overcharged. The range of the thermometer is indeed great and sudden, sometimes amounting to 25° or 30° in a day; but, in his opinion, the corresponding flexibility of constitution which it produces, is beneficial. The country and climate, he adds, in configuration, character, and productions, correspond more nearly to those of China than to any other; and are probably as favourable to population, comfortable occupation in the open air, and longevity, as those of countries much more celebrated in these respects.

VEGETABLE PRODUCTIONS.—The United States have already made astonishing progress in industry and wealth. Agriculture has ever been the staple pursuit of the North Americans; and agricultural products have always constituted their principal articles of export. The first exports of the early colonists were the natural products of the forest: furs, lumber, pitch and tar, pot and pearl ashes, with some cattle and provisions, constituted the chief articles of trade from the northern provinces in the early part of the eighteenth century; but rice and tobacco had even then become important items of exportation from the southern colonies. At a later period wheat became the great staple of the middle and western states, and cotton that of the more tropical sections of the country. Flax and hemp thrive particularly in the rich soil of Kentucky. Maize, being suited to a great variety of soils and situations, is so universally cultivated as to have received the name of corn, as a distinctive appellation. Oats for horses, and rye for distillation, are the prevalent species of grain in the northern states; while, in the extreme south, the sugar-cane is found to flourish, and to supply about one-half of the American consumpt of sugar. Grapes for wine, and beet for sugar, are articles of prospective culture, regarding the value of which sanguine expectations are entertained. Cotton, the great staple of the United States, is raised in small quantities in Virginia and Kentucky, and is chiefly produced in the country farther south. It is the produce of the herbaceous or annual cotton-plant, and is of two kinds, the sea-island or long staple, and the upland or short-staple. The former, which is of a superior quality, is grown only along the sea-coasts of South Carolina and Georgia. Cotton was first sown in the United States in or about 1787, and was first exported in small packages in 1790; in 1836 the cotton crop produced 480,000,000 lbs., of which 386,000,000 lbs. were exported. It is estimated that good lands yield on an average from 250 to 300 lbs. of clean cotton per acre, and inferior lands from 125 to 150; and that the capital invested in the cultivation is nearly 800,000,000 dollars, or about £180,000,000 sterling. Of late a valuable oil has been obtained from the seeds. A new species, called Nan-king cotton, of a rich, yellowish colour, and fine quality, is also beginning to be cultivated. Tobacco has been the staple of Virginia and Maryland from their first settlement, and is also extensively grown in Kentucky, Ohio, Missouri, and other states. It is decidedly superior in quality to the tobacco of most other countries; and, besides the large quantity made into cigars, snuff, and twist for chewing, there is an annual exportation of from 80,000 to 90,000 hogsheads of leaf tobacco, of the value of about £1,200,000. The sugar-cane is cultivated with success in Louisiana, where several varieties are reared. The cane does not produce seed any where in Louisiana, but it blooms on the sea-coast. The annual crop is about 100,000 hhds. of sugar, with 63,000 hhds. of molasses. Rice was first cultivated in South Carolina in 1694, since which time its culture has been so successful, that, in addition to supplying the home consumption, it affords an annual surplus of from 130,000 to 150,000 tierces, of the value of £400,000 or £500,000, for exportation. We have no means of estimating the value of the grain, sheep, and cattle, raised in the United States. Indigo was formerly produced in large quantities in Carolina and Georgia, but, since the introduction of cotton, the cultivation of this plant has almost entirely ceased.

MINERAL PRODUCTIONS.—The United States are richly supplied with valuable minerals; but it is only of late that the mines have begun to be a source of wealth; nor are they yet worked in a manner or to an extent worthy of their great importance. Gold, iron, and lead, are extensively diffused; coal and salt exist in abundance; while beautiful and durable building materials are furnished by the marble, freestone, and granite quarries of different sections of the Union. The gold region, so far as the mining operations have yet been attempted, may be considered as extending along the



cess, and will afford new facilities in the prosecution of this industry. The lead mines of the United States are extre hitherto they have been worked but very imperfectly. They ar between the Gasconnade, the head waters of the White river, and in Wisconsin territory and Illinois, between the Wisc rivers, and on the opposite side of the latter. A very rich s of lead also occurs in St. Lawrence County, New York; and the south-western part of Virginia. The annual produce of is about 3,000,000 lbs., that of the mines on the Upper M 8,000,000 lbs. The American manufactures of shot, and of now nearly supply the domestic consumption. Salt is chiefly of springs, which are plentifully distributed throughout the cou in the Mississippi valley. In 1835, 2,000,000 bushels of salt wer daga springs in New York; 1,000,000, in the western part of Pen at the Kanhawa springs in Virginia; 500,000, in Ohio; about Massachusetts from sea-water; forming altogether, with the the other states, an aggregate of about 7,000,000 bushels. quality is very widely and copiously distributed, and is daily importance, as it is more extensively used in the manufac and salt, in driving steam-engines, and for domestic purpos sorts of coal, the anthracite and the bituminous. The former worked in Pennsylvania, from three distinct beds; two of wh Lehigh and the Susquehanna, and the head waters of the northern branch of the Susquehanna, the third lies on both wana river, and of the northern branch of the Susquehanna, a mouth of that tributary. This coal is largely consumed in th New England, nearly 900,000 tons being brought to market a minous coal is found all over the valley of the Mississippi, on th Potomac, and on the James river in Virginia. We have no d the total consumption, but it is estimated that about 250,00 consumed in and about Pittsburg; 150,000 in the salt manufactu sylvania; and 300,000 in the salt-works of the Kanhawa; to w consumption of the towns in the valley for domestic purposes will not be doubted that coal mining is already an important b productions of the country.

PEOPLE.—The great mass of the citizens of the United States of emigrants from Great Britain and Ireland; but many are also

savages, and look at the rapid and steady increase which has marked its progress, we see a new and most striking phenomenon in the history of the human race. Though there has been a great accession of numbers by immigration from Europe, ever since the first settlement of the country, yet there is no reason to doubt that the growth of the population is chiefly owing to the natural increase of a community multiplying itself without any check from difficulty of subsistence, or want of unoccupied lands. Nor is it a less interesting consideration, that this same facility of self-multiplication will continue to exist for an indefinite period; and that, should no external or accidental cause interfere, the United States will, before the end of the present century, form the most numerous Christian community, speaking one language, in the world. The first official census was taken in 1790, since which period there have been five decennial enumerations; their results are stated in the following table.

Year.	*Whites.*	*Slaves.*	*Free Coloured.*	*Total Coloured.*	*Total Population.*
1790	3,172,464	697,897	59,466	757,363	3,929,827
1800	4,304,502	893,041	108,398	1,001,439	5,305,941
1810	5,862,004	1,191,364	186,446	1,377,810	7,239,814
1820	7,872,711	1,543,688	238,197	1,781,885	9,654,596
1830	10,537,378	2,009,043	319,599	2,328,642	12,866,020
1840	14,389,368	2,369,553	361,606	2,731,159	17,120,527

The black population of the United States, in which are included not only the negroes, but also the mulatto and mixed races, forms somewhat more than one-sixth of the total population. The free blacks are not generally admitted to political privileges; in some States their testimony is not admissible against a white man, and they are subject to some other civil disabilities. Slavery has been abolished in the eastern states and in New York, and prospectively in Pennsylvania and New Jersey, and has never existed in the north-western States to the north of Kentucky. The maritime slave-trade has been declared piracy; but a great and active inland trade is carried on from the Atlantic slave states to the new settlements in the south-west; and it is believed that the number clandestinely introduced into the country from the other side of the Atlantic has been considerable, even since the trade was declared illegal. Slavery may be said to exist in thirteen states, namely, Delaware, Maryland, Missouri, Arkansas, and all the states south of the Potomac and the Ohio. The slaves form rather more than one-third of the population of the slave-holding states; but they are unequally distributed, and the whites generally preponderate.

The aboriginal races, or Indians resident within the territory of the United States, are not included in any of the enumerations. Their total number within the constituted states and territories is estimated at about 96,000; between the states and the Rocky Mountains, 150,000; west of the mountains, 50,000; total, 296,000.

EDUCATION.—Various provisions have been made in all the states for the literary and scientific education of their citizens; in most of them common and free schools are widely distributed; and high schools, gymnasiums, and colleges, are numerous. The necessary expense is provided for either by means of "school funds," accumulated from various sources, or by taxation; and, in the new states and territories, a thirty-sixth part of the public lands is reserved for the purposes of education. But in several of the latter, no general system of instruction has yet been introduced; and indeed, throughout the Union, there is neither any general system, nor is education carried to that extent and degree of efficiency which seem necessary, under so democratic a government, to render the people capable of beneficially exercising and performing their important political duties and privileges. "One of the most common errors, in my opinion," says Mr. Combe, "committed by foreigners who write about America, as well as by the Americans themselves, is greatly to over-estimate the educational attainments of the people. The provision in money made by law for the education of all classes is large, compared with such countries as Britain or Austria; but, contrasted with what is necessary to bestow a really good education, it is still very deficient." And, owing to various causes, which he specifies, the education received by probably nineteen-twentieths of the children in the agricultural districts is extremely defective.—(*Notes*, III. 103.) The Secretary of the American Common School Society estimates the total number of children in the United States between the ages of four and sixteen years, at 3,500,000; and of this number 600,000 do not enjoy the benefits of a common school education.—(*Ib.* III.) Lecturing to the people in lyceums is extensively practised, and as a mode of public instruction

it is well calculated to advance their intelligence; but hitherto, in consequ the defects of their education, in the primary schools, it has not yielded half vantages. Education, however, in the higher branches of science, literatu professional knowledge, is amply provided by a great number of universities a leges, whose names, situations, &c. will be found in the following lists:—

COLLEGES IN THE UNITED STATES.

REMARKS.

The Colleges marked thus (*) are under the direction of the *Baptists*; thus (†) *Episcopalians*; thus (‡) *Methodists*; thus (§) *Catholics*.

With respect to the Colleges which are *unmarked*, the prevailing religious influence of those that are in the New England States is *Congregationalism*; of the most of the others, *Presbyterianism*. Norwich University, Vt., is an institution recently established by the *Universalists*.

Some of the Colleges above enumerated are not in full operation; and scarcely deserve a place in the Table. Several other Colleges have been incorporated, which are not yet fully organized.

The information given in these Tables has been obtained from various sources. Much aid has been derived from a valuable document entitled *Statistics of Colleges and Theological Seminaries in the United States*, found in the Appendix to the "Twenty-fourth Annual Report of the Directors of the American Education Society."

The column of *Libraries* includes the number of volumes in the *College Libraries* and in the *Students' Libraries*. In some instances, the number of volumes in the Students' Libraries exceeds that of the College Library.

Schools for the study of law are much less frequented than schools for the study of the other professions. The first institution of this nature, of much note, that was established in the United States was the Law School at Litchfield, in Connecticut, which had from 1798 to 1827, 730 students; but is now discontinued.

RELIGION.—There is, in the United States, no national religion or established church: every citizen is left to choose for himself; but the great bulk of the people profess Christianity according to some one or other of its numerous forms and creeds and the churches and the clergy of all sects are supported entirely by the voluntary contributions of their members. In the newer States the supply of ministers and churches is rather deficient; but in the older and more densely-peopled States both are provided for in a manner not surpassed by the establishments of any country with respect to the number of active ministers of religion, their comfortable subsistence, and the respectability of their character and attainments. The following table contains an approximative statement or summary of the principal religious denominations, with the number of their churches or congregations, ministers, members or communicants, and the amount of population belonging to each denomination:—

SUMMARY OF THE PRINCIPAL RELIGIOUS DENOMINATIONS.

Denominations.	*Churches, or Congregations.*	*Ministers.*	*Members, or Communicants.*	*Population.*
Baptists,	6,319	4,239	452,000	4,300,000

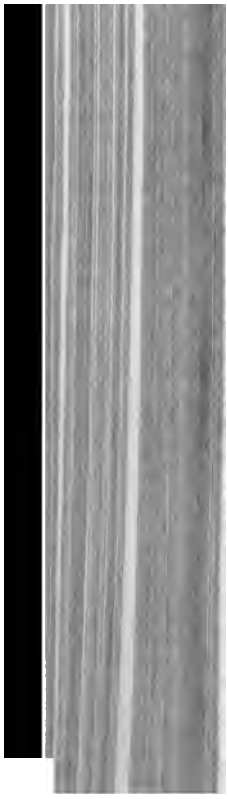
New Jerusalem Church,	27	33	..	5,000
Presbyterians,	2,807	2,225	274,084	2,175,000
" Cumberland,	500	450	50,000	
" Associate,	183	87	16,000	
" Reformed,	40	20	3,000	
" Associate Reformed,	214	116	12,000	
Shakers,	15	45	6,000	6,000
Tunkers,	40	40	3,000	30,000
Unitarians,	200	174	..	180,000
Universalists,	653	317	..	600,000

The above statements of the number of churches, ministers, and members of the several denominations, have been derived chiefly from recent official documents published by the different denominations; but the last column contains rather a vague estimate, which has appeared in various publications, of the total number of people who are attached to, or show a preference for the several different religious persuasions.

The Presbyterians are the prevailing sect throughout New England, New York, New Jersey, Pennsylvania, and the western parts of Maryland and Virginia; they are also numerous in the north-western States. The Methodists are more generally diffused throughout the States than any other sect. They are least numerous in New England and Louisiana, and most numerous in the middle States. The Baptists predominate in Rhode Island, Virginia, Kentucky, and most of the States farther south. The Catholics are numerous in the cities of the middle States, in which there are many French and Irish; they are spread over Maryland, have many congregations in Missouri, Illinois, and part of Kentucky, and predominate in Louisiana. They have one archbishop, who resides at Baltimore, and ten bishops. The Episcopalians have congregations in all the Atlantic and in most of the western States; they are most numerous in Connecticut, the middle States, Virginia and South Carolina; but in none do they hold more than the third or fourth rank in respect of numbers. They have twelve bishops in the Atlantic States, one in Ohio, and one in Kentucky. The Unitarians have churches in all the large cities of the eastern and middle States; but, except in Massachusetts, they have made little progress among the country population. The Quakers are most numerous in Pennsylvania; they have also congregations in New York, Virginia, North Carolina, and New England. Besides the distinct sects mentioned in the table, schisms occasionally arise, by which congregations become separated into two parts, each following its favourite pastor, without any change of denomination, discipline, or mode of worship.

GOVERNMENT.—The Government, as established by the constitution of 1787, is in form a federal representative democracy. The executive power is vested in the President, who holds his office for the term of four years. He is chosen by the electoral colleges of the several States, each of which consists of a number of electors equal to the whole number of the senators and representatives of the State in Congress. These electors are themselves appointed in the manner prescribed by the State legislatures; being in some cases chosen directly by the people, and in others by the legislatures. A majority of the aggregate number of votes given is necessary to the President's election; but if none of the candidates has such a majority, the House of Representatives of the General Congress chooses one of the three candidates who have the greatest number of votes; and, in doing so, the vote is taken by States, the representatives of each State having only one vote, which must of course be



a salary of 25,000 dollars, and the white house at Was
residence. The Vice-President is president of the Senate; a
resignation, or removal of the President, the powers and d
volve upon him for the remainder of the term. This provisio
come into operation in the present year (1841) in consequence
Harrison, the ninth president, after he had held the office onl

The legislative power is vested in a Congress, consisting o
of Representatives. The Senators are chosen by the legislature
for the term of six years, each State sending two Senators;
cation is required than that the person so chosen shall hav
thirty years, and shall have been nine years a citizen of the
Senate, in addition to its legislative powers, has a concurrent
dent in the ratification of treaties, and on executive nominat
power of trying persons impeached by the House of Represent
tatives are chosen for the term of two years by the people of
electors being those qualified to vote for the most numerous b
gislature. The number of the representatives of each State is re
of its population, three-fifths of the slaves being included in
slaveholding states (that is to say, five slaves being counted a
there is one representative for each 47,700 inhabitants. The
tives choose their own speaker and other officers; they have
peaching public delinquents; and all bills for raising revenue
them. No person who has not attained the age of twenty-five
years a citizen of the United States, is eligible as a represent
must assemble at least once a year. It has the power to impose
ties, imposts, and excises, except on articles exported; to b
credit of the United States; to regulate commerce; to coin
the standard of weights and measures for all the Union; to est
post-roads; to make laws for the punishment of piracies and f
the high seas, and of offences against the law of nations; to d
letters of marque and reprisal; to raise and support an army a
for calling out the militia to execute the laws of the Union, su
and repel invasions; to provide for arming, organizing, and dis
and to make all laws necessary to carry into execution the p
constitution in the government of the United States. Congres
direct authority over the district of Columbia, as is held by t
over their respective territories. Congress meets on the first M
each year, and continues to sit till the business is disposed of

department are attached a diplomatic bureau, a consular bureau, a home bureau, the archives, and the patent office.

The Secretary of the Treasury superintends the financial concerns of the government; he is required to report annually to Congress the state of the finances, and to recommend measures for improving the condition of the revenue. To this department are attached, besides the secretary, two controllers, five auditors, the register, the treasurer, the solicitor of the treasury, the mint, and the land office. The principal mint was established, in 1792, at Philadelphia, and still remains there; but branch mints have been established at Charlotte, in North Carolina; Dahlonega, in Georgia; and New Orleans.

The War Department is charged with the direction and government of the army; the constructing of fortifications; the execution of topographical surveys; and the direction of Indian affairs. Attached to, and under the direction of the Secretary at War, are the engineer department, ordnance department, topographical bureau, office of Indian affairs, requisition bureau, bounty-land bureau, pension office, paymaster-general's office, adjutant-general's office; quartermaster-general's office, commissary-general's office, &c.

The Secretary of the Navy has the management and control of the navy in general. This department was instituted in 1798: and, in 1815, the Board of Commissioners for the Navy, three in number, was instituted. The board, under the superintendence of the secretary, execute the ministerial duties of the department relative to the construction and employment of ships, &c.

The post-office is under the charge of the postmaster-general, who has the appointment of the postmasters throughout the country, and the power of making contracts for carrying the mail. To this department belong the contract office, the appointment office, and the inspection office. The number of post-offices in the United States, on 1st May 1840, was 13,376; the length of mail routes in the year preceding 1st July 1839, was 133,999 miles; and the annual transportation of the mails, 34,496,878 miles. The revenue for the same year was 4,476,638 dollars, and the expenditure 4,620,117 dollars, being an excess of 147,479 dollars.

The army is under the command of the major-general, who is styled the General-in-Chief, and who resides at Washington. There are two divisions of the army, at the head of each of which is a brigadier-general. The western division comprehends all the country west of the Mississippi, with head-quarters at Jefferson barracks, Missouri; the eastern comprises the country east of the Mississippi, with head-quarters at Elizabeth-town, New Jersey. Motives of economy and political jealousy have combined to keep the force of the army exceedingly low. It consists at present of 57 officers of the general staff, 83 of the medical department, 19 of the pay department, 3 of the purchasing department, 43 of the corps of engineers, 36 topographical engineers, 323 of the ordnance department; two regiments of dragoons, mustering 1498; four regiments of artillery, 3020; eight regiments of infantry, 7496; total, 12,539. The ranks of the army are chiefly filled up by foreign immigrants, the necessary discipline being quite uncongenial to the feelings and habits of free citizens, and the pay being much less than good tradesmen or labourers can earn by any other employment. The militia of the states is very formidable in point of numbers, amounting to 1,326,821 men; but this vast body is imperfectly armed and organized, and either extremely deficient in, or entirely destitute of, discipline and subordination.

The navy acquired much reputation in the last war with Britain; but principles of economy have here also interfered, and kept it below the state which the exigencies of the country require. In June 1840 it consisted of 11 ships of the line, of from 74 to 120 guns; 12 frigates of the first class; 2 of the second class; 21 sloops of war; 4 gun-brigs; 8 schooners; 4 steam-ships; and 1 store-ship; but of these several were only on the stocks, and most of the rest were laid up in ordinary.

The federal judiciary establishment consists of a supreme court, nine circuit courts, and thirty district courts. The judges are appointed by the Senate, on the nomination of the President, and hold office during good behaviour. The supreme court is composed of a chief justice and eight associate justices, who hold a court annually at Washington; each justice also attends a certain circuit, which comprises several districts, and, with the district judge, forms a circuit court, which is held in each district of the circuit. The district courts are held by the respective district judges alone. There is a district attorney in each district, whose duty it is to prosecute all offences cognizable by the law of the United States, and to manage all civil actions in which the Executive are concerned as parties. The marshal of each district attends the district and circuit courts, and executes the precepts directed to him

preme Court of the United States. The mode of electing an
bers of the legislative bodies, and the executive and judiciary c
the constitution of each State, and is a matter with which th
has no right to interfere. The constitutions of all the States
cal revisals by the citizens; that of Rhode Island is the only c
no change since its origin; it is still regulated by the cha
Charles II.

FINANCES. — The revenue and taxation of the United State
portion to the wealth and extent of the republic. The custom
and tonnage, form the most productive branch of revenue. I
the customs amounted to 36,306,874 dollars; from that perio
tuated between 13,000,000 and 20,000,000; from 1825 till 18
to 30,000,000; and since the general reduction of the rates o
of 1832 and 1833, they have fallen to about half the last-mentio
great source of revenue is the public domain, or public lands, w
of territory ceded to the general government by the several Stat
territory of Louisiana purchased from France, and of those in F
Spain. After thus acquiring a claim to unoccupied lands from th
from individual powers, the Indian title to the soil is next extin
it from the native tribes by whom it is occupied. The lands are
veyed, according to a general system, so that the whole country
ships of six miles square. Each township is subdivided into th
these are still further subdivided into quarter, half-quarter, and
tions. The lands thus surveyed are offered for sale by proclamat
and by law must be sold by public auction, the minimum upset
and twenty-five cents (about five shillings) an acre, ready mo
each township is reserved for the support of schools; and all s
mines are reserved from sale, unless by special order of the Pre

	24,760,667·99
Redemption of Treasury notes in the first three quarters, interest as well as principal, ...	9,891,759·83
This includes two millions and three-fourths paid in for duties and lands last year, but not carried on the Register's books till 1839. From this cause, the expenditures on that account will appear larger by that amount than they actually have been within those quarters.	
Estimated amount of notes redeemed in the fourth quarter, .	1,000,000·00
Aggregate payments, .	35,661,428·72
Leaving an available balance of money in the Treasury, on the 31st of December 1839, of . .	1,556,384·93
	37,217,812·75

he money required for the local expenditure of the several States is raised by the authority of r respective legislatures, and applied at their discretion, without any interference of the general ernment; but of the nature and amount of the public revenue of the several States, our limits ne- arily preclude us from giving any details. The United States have no public debt; but most of separate States have contracted debts to a large amount, generally for the purposes of public rovements. The following table exhibits a statement of these debts, prepared by Mr. Flagg, late ıptroller of the State of New York.

TABLE OF STATE DEBTS.

States.	1. *Amount issued prior to* 1838.	2. *Amount stated as issued and authorized.*	3. *Actual Stock Debt.*— 1839.	4. *Total Stock and Domestic Debt.*

bonds issued and lent to corporations, and those issued to procure m
works by the State. In both cases the stock is disposed of in the foreign
be sent from the United States to pay the interest; and it is material to
all loans of credit certificates to incorporations should be at once reco
State debts.

A great proportion of the stock debts embraced in the third column
tracted within the last five years; and during the last ten years, six-seve
the stock has been issued. The State of New York commenced issuing
three years since; and none of the States had issued stock previous to
amounts to satisfy revolutionary claims. The stock issued by the sever
five years since 1820, is as follows:

From 1820 to 1825,	. . . . .
From 1825 to 1830,	. . . . .
From 1830 to 1835,	. . . . .
From 1835 to 1840,	. . . . .

And if to the amount of stock actually issued by the several States
(108,593,392 dollars) be added the sums issued by Florida and the City of
of 120,659,497 of debt actually created within the last five years!

There is a great number of cities in the Union, besides those enumerat
which have contracted debts, the amount of which is unknown. The
has issued its bonds, post-notes, and other evidences of debt, and put the
amount probably of 20,000,000 dollars. There are, also, a class of mone
possess, or have assumed, the right of issuing bonds, and these have bee
Europe, to the amount of several millions of dollars, which form an additi
country. Shares in the capital stock of the Bank of the United States,
companies, are held abroad to the amount of millions of dollars, and the
are to be paid from the resources of this country. If the whole sum on w
paying interest or dividends to foreign capitalists was fairly ascertained
200,000,000 dollars, and the specie drained from the country on this acc
12,000,000 dollars annually. For it is fair to presume, that this sum must b
enterprising character of our countrymen will induce them to import
amount which can be paid for by the surplus products of the country.

The statutes of seven States authorize additional stock to be issued to
dollars, of which sum between seven and eight millions are to be issued
York. If these authorized debts be added to the total of the fourth column in
make an aggregate of 244,000,000 dollars.

From 1830 till the close of 1836, during which time the States borrowed abo
country, to all appearance, was in a state of unprecedented prosperity. The
business men in the land were deluded by the belief, that substantial rich
without that toil and pains-taking which distinguished their frugal ancestor
them as the only process to secure permanent wealth, vigorous constitution

From 1820 till 1830, it is shown by the table of debts, less than twenty-si
stocks were issued. And during the same period the imports from foreig
exports by about 40,000,000 dollars. The exports of specie during this period
several millions of dollars. The sales of lands averaged per year about 1,
exports of flour averaged about 1,000,000 barrels annually. The capital of
Union increased from 137,000,000 dollars in 1820, to 145,000,000 dollars in 1830,
44,800,000 dollars in 1820, to 61,300,000 dollars in 1830.

From 1830 till 1840, say ten years, the amount of stocks issued, including
New York, exceeded 160,000,000 dollars. During the same period, the impo

slave labour than agriculture. The principal agricultural productions of the country have been already mentioned; but no means exist of ascertaining their amount in quantity or value.

§ *Manufactures.*

During the war of the revolution some manufactures sprung up in the States; and, on the adoption of the new constitution, provision was immediately made for the support of the trades, handicrafts, and manufactures of the country, by protecting duties, which are still continued. From the endless variety of soil and climate, which produce in abundance nearly every species of the raw material, and the cheap and inexhaustible supply of moving power furnished by the torrents and rivers, combined with the improvements which are daily making in the best machinery, the United States seem destined ultimately to cope with any other nation in manufacturing industry. At present, however, but a small proportion of the labour of the country is applied to this branch of industry, and only a few of the finer fabrics are produced.

Cottons.—The first cotton mill was erected at Providence, Rhode Island, in 1790; and power-looms were introduced at Waltham in 1815; in 1835, it was estimated that the number of spindles was about 1,700,000; of looms, 48,000; the annual consumption of cotton in the mills from 85 to 90 millions of pounds, and the value of their produce about fifty millions of dollars, or £10,000,000 sterling. The American cotton stuffs are more substantial and durable than the English, and they are in consequence preferred in the foreign markets to which they have been carried. They include sheetings and shirtings, printed calicoes, jeans, carpeting, sail-cloth, &c.

Woollens.—The manufacture of woollens has been carried on in families for domestic use from an early period; but it is only recently that large establishments have been formed for the purpose; some of which are supplied with the most improved machinery. The number of sheep in the United States has been computed, or rather conjectured, at 20,000,000, yielding probably not less than 50,000,000 pounds of wool, and from four to five millions of pounds are imported. The total value of the woollen manufacture cannot be less than from £13,000,000 to £14,000,000 sterling. Among the products are broad cloths, cassimeres, satinets, flannels, blankets, carpets, &c. Five hundred looms produce annually upwards of a million of yards of ingrained Venetian and Brussels carpeting.

Leather, &c.—The leather manufactures, including boots, shoes, saddlery, trunks, &c. are an important branch of industry; and foreign hides to the value of nearly £500,000 are annually consumed. Not only is the home trade supplied, but there is a surplus for exportation. The value of the manufacture is estimated at £9,000,000, and that of hats and caps of wool, fur, and leather, including £200,000 worth of straw-bonnets and palm-leaf hats, is supposed to amount to £3,000,000 annually.

Linens, &c.—Hemp and flax are manufactured in considerable quantities, though the general use of cotton has in a great measure superseded linen as an article of clothing. In 1810, 23,503,590 yards of linen were made in families, and this cloth is still made in that way only. About 4,500,000 yards of bagging for cotton are manufactured annually; and the yearly value of cables and cordage, to the spinning of which very ingenious machinery has been applied in some places, is estimated at £1,000,000. Some sail-cloth is also made.

Glass and paper were early objects of manufacturing industry in the colonies. The value of the produce of the glass furnaces was estimated, in 1831, at £600,000, but is now much larger. The value of the paper made in the United States is estimated to be from £1,000,000 to £1,250,000 annually; which, considering the great consumption of the country, and the small amount imported, would appear to be rather below than above the truth. From the report of the York Convention of the Friends of Domestic Industry, it appears that, in 1831, there were thirty chemical establishments in the United States producing chemical articles used in the arts to the value of £200,000 a-year. The annual value of the cabinet-ware was estimated by the same body at £2,000,000, including a surplus which is produced for exportation. Horn, wood, ivory, and shell combs are made, to the value of about £160,000; and buttons to about the same amount. Both articles are exported.

§ *Fisheries.*

The Fisheries have been pursued by the New Englanders with a rare spirit of hardy enterprise, from an early period. The whale-fishery is prosecuted in the Atlantic Ocean chiefly to the south of the line, for the black whale; and in the Southern, Indian, and Pacific Oceans, for the spermaceti whale. It is carried on chiefly from New

Bedford and Nantucket; and also, but on a smaller scale, from New London, Sag Harbour, Falmouth, Bristol, Hudson, and other places. About 10,000 men are engaged in it, and the seamen are paid, not by fixed wages, but by a certain share in the profits of the voyage. The vessels in the Indian and Pacific Oceans are often absent for two or three years. Seal oil and furs are also obtained in the Antarctic seas. The annual produce exceeds the value of £1,000,000 sterling. The cod fishery is pursued on the banks and coasts of Newfoundland and Labrador, and employs upwards of 60,000 tons of small craft, some of which make several trips a-year. Those engaged in the coast fisheries generally remain longer. The produce of this fishery may be estimated at about £300,000 sterling a-year, about one-half of which is exported. The mackerel fishery employs about 50,000 tons of shipping, and produces about £400,000 annually.

§ *Commerce.*

The commerce of the United States has attained an amazing magnitude; there is no part of the globe which is not visited by American merchantmen; and the foreign trade, the coasting trade, and the inland trade carried on over an unequalled extent of artificial and natural lines of communication, are all on an equal scale. The domestic commerce may be divided into three branches: 1. That which is carried on coastwise, up the bays and large rivers, and on the great lakes in schooners, sloops, and steam-boats. 2. That which is carried on chiefly in steam-boats, but partly in rude flat-bottomed boats, on the Mississippi and its affluents. Of the steam-boats there are said to be upwards of 500 continually plying on these streams; but most of the flat-bottomed boats make but a single voyage down the river, at the end of which they are sold, and broken up for the materials of which they are constructed. The great centre of this trade is New Orleans; which, situate at the only outlet of the great valley, is necessarily the entrepot of all the produce destined for exportation, and of all the foreign articles required to supply the wants of the people of the Western States. 3. The overland trade between the Western and Atlantic States consists principally in hogs, horses, cattle, and mules, which are driven every year to the Atlantic States to the amount of many millions of dollars. But the difficulty of conveyance has hitherto prevented any other return than money. To obviate this disadvantage several canals and railroads have been undertaken, and partly finished, which will be used for the transport of merchandise as well as passengers, across the mountains. The four maritime states of New England are those most devoted to navigation and trade; and Massachusetts, though it contains less than one-twentieth of the population of the United States, owns more than one-fourth of the shipping tonnage. Next to the New Englanders, the people of New York, Pennsylvania, and Maryland, are the most commercial. Such of the inhabitants of those States, and of the Atlantic States to the south of them, as live near the mouths of the rivers, or on the great bays and estuaries, are generally of sea-faring habits. They are extremely skilful in building and managing those fast-sailing schooners and small craft which are perpetually crossing these broad waters in every direction.

The exports consist chiefly of agricultural produce, and the naval stores, lumber, and other productions of the forests. On an average of eight years, from 1803 to 1811, the produce of agriculture constituted about three-fourths in value of all the exports; of the forests, about one-ninth; of the sea, about one-fifteenth; and of manufactures, about one-twentieth; and on the average of ten years, from 1821 to 1830, the produce of agriculture constituted a little more than three-fourths in value of the exports; of manufactures, about one-twelfth; of the forests, about one-thirteenth; and of the sea, about one-thirteenth. The imports consist chiefly of manufactured articles of all sorts, particularly the finer kinds; of tropical productions, as sugar, coffee spices; of tea, hides, wines, spirits, fermented liquors, &c.

1. EXPORTS OF THE PRODUCE OF THE UNITED STATES.

Summary Statement of the Value of the Exports of the Growth, Produce, and Manufacture of the United States, during the Year ending 30th September 1839.

THE SEA.	Dollars.
Fisheries.—	
Dried fish, or cod fisheries,	709,218
Pickled fish, or river fisheries (herring, shad, salmon, mackerel),	141,320
Whale and other fish oil,	515,483
Spermaceti oil,	85,015
Whalebone,	288,790
Spermaceti candles,	178,142
	1,917,969
THE FOREST.	
Skins and Furs,	732,087
Ginseng,	116,904
Products of Wood—	
Staves, shingles, boards, hewn timber,	2,270,603
Other lumber,	327,687
Masts and spars,	37,122
Oak bark, and other dye,	309,696
All manufactures of wood	650,291
Naval stores—	
Tar, pitch, rosin, and turpentine,	688,800
Ashes — pot and pearl,	620,369
	5,764,559
AGRICULTURE.	
Products of Animals—	
Beef, tallow, hides, horned cattle,	371,646
Butter and cheese,	127,550
Pork (pickled), bacon, lard, live hogs,	1,777,230
Horses and mules,	291,625
Sheep,	15,960
Vegetable Food—	
Wheat,	144,191
Flour,	6,925,170
Indian corn,	141,095
Indian meal,	658,421
Rye meal,	145,448
Rye, oats, and other small grain and pulse,	72,050
Biscuit, or ship bread,	349,871
Potatoes,	57,536
Apples,	50,875
Rice,	2,460,198
	13,588,866
Tobacco,	9,832,943
Cotton,	61,238,982
All other agricultural products—	
Flaxseed,	161,896
Hops,	72,425
Brown sugar,	28,722
	263,043
MANUFACTURES.	
Soap and tallow candles,	453,471
Leather, boots and shoes,	173,859
Household furniture,	361,840
Coaches and other carriages,	52,950
Hats,	123,165
Saddlery,	42,743

	Dollars.
Wax,	68,961
Spirits from grain, beer, ale, and porter,	142,085
Snuff and tobacco,	616,212
Lead,	6,003
Linseed oil and spirits of turpentine,	78,757
Cordage,	25,899
Iron—pig, bar, and nails,	134,588
Castings,	61,100
All manufactures of,	748,862
Spirits, from molasses,	183,446
Sugar refined,	521,117
Chocolate,	4,039
Gunpowder,	197,162
Copper and brass,	81,334
Medicinal drugs,	97,418
	4,175,011
Cotton, piece goods—	
Printed and coloured,	412,661
White,	2,525,301
Nankeens,	1,492
Twist, yarn, and thread,	17,465
All manufactures of,	18,114
	2,975,033
Flax and Hemp—	
Cloth and thread,	2,010
Bags, and all manufactures of,	2,047
Wearing apparel,	167,957
Combs and buttons,	37,966
Brushes,	4,186
Billiard-tables and apparatus,	2,504
Umbrellas and parasols,	11,618
Leather and Morocco skins not sold per lb.,	12,952
Printing presses and types,	33,231
Fire engines and apparatus,	2,036
Musical instruments,	7,413
Books and maps,	32,854
Paper and other stationery,	80,149
Paints and varnish,	41,450
Vinegar,	3,745
Earthen and stone ware,	11,645
Manufactures of Glass,	43,448
Tin, pewter, lead, marble, and stone,	40,276
Gold and silver, and gold leaf,	5,264
Gold and silver coin,	1,906,358
Artificial flowers and jewellery,	3,402
Molasses,	3,438
Trunks,	1,965
Bricks and lime,	16,298
Domestic salt,	64,272
	5,515,520
Articles not enumerated—	
Manufactured,	542,909
Other articles,	649,089
	1,236,998
TOTAL EXPORTS,	103,553,891

2. VALUE OF DIFFERENT ARTICLES IMPORTED.

Value of Goods, Wares, and Merchandise Imported into the United States, during the Year ending 30th September 1839.

Species of Merchandise. FREE OF DUTY.	*Value in Dollars.*
Articles for the use of the United States,	489
Articles for Philosophical Societies, &c.	
Philosophical apparatus,	10,168
Books, maps, and charts,	43,383
Statuary, busts, casts, &c.,	2,330
Paintings, drawings, etchings, and engravings,	4,542
Specimens of botany,	5,087
Models and inventions of machinery,	15
Anatomical preparations,	1,356

Species of Merchandise.	*Value in Dollars.*
Antimony, regulus of,	13,667
Spelter, or zinc,	136,905
Buhrstones, unwrought,	46,417
Brimstone and sulphur,	101,164
Bark of the cork tree,	6,544
Clay, unwrought,	6,737
Rags of any kind of cloth,	568,318
Undressed furs,	881,735
Hides and skins, raw,	3,158,029
Plaster of Paris,	127,714

2. VALUE OF DIFFERENT ARTICLES IMPORTED—(Continued.)

Species of Merchandise.	Value in Dollars.
Barilla,	128,627
Wood, Dye,	225,420
Wood, Mahogany, unmanufactured,	304,225
Animals, for breed,	40,224
Animals, Other,	261,226
Old pewter,	44
Tin, In pigs and bars,	268,089
Tin, In plates and sheets,	1,145,183
Brass, In pigs and bars,	1,230
Brass, Old,	1,227
Copper, In pigs and bars,	1,118,165
Copper, In plates, suited to sheathing of ships,	619,486
Copper, Old, fit only for remanufacture,	61,242
Bullion, Gold,	86,540
Bullion, Silver,	149,680
Specie, Gold,	1,078,040
Specie, Silver,	4,280,916
Tea from India, China, &c.,	2,424,594
Coffee,	9,744,103
Cocoa,	75,838
Fruits, Almonds,	170,641
Fruits, Currants,	56,749
Fruits, Prunes,	60,216
Fruits, Figs,	68,457
Fruits, Raisins, Muscatel,	802,068
Fruits, Other,	187,497
Spices, Mace,	14,513
Spices, Nutmegs,	278,499
Spices, Cinnamon,	82,627
Spices, Cloves,	101,964
Spices, Pepper,	185,053
Spices, Pimento,	144,629
Spices, Cassia,	32,519
Spices, Ginger,	12,823
Camphor,	15,286
Silks, Other than India, viz. Lace veils, shawls, shades, &c.,	345,490
Silks, Other manufactures of,	18,085,206
Manufactures of silk and worsted,	2,219,894
Camlets of goat's hair, or camel's hair, &c.	128,289
Worsted stuff goods,	7,025,8[illegible]8
Linens bleached and unbleached,	6,731,278
Ticklenburgs, Osnaburgs, and burlaps,	452,269
Sheetings, brown and white,	535,789
Bolting cloths,	64,2[illegible]3
Wool, not exceeding 8 cents. per lb.,	527,620
Quicksilver,	345,660
Opium,	214,975
Crude Saltpetre,	369,152
Other articles,	8,707,402
TOTAL,	76,401,792

MERCHANDISE PAYING DUTIES AD VALOREM.

Manufactures of Wool—	
Cloths and cassimeres,	7,078,906
Merino shawls,	282,467
Blankets not above 75 cents each,	821,889
Blankets, above 75 cents each,	534,197
Hosiery, gloves, mits, and bindings,	1,037,096
Articles not specified,	522,554
Woollen yarn,	156
Worsted yarn,	368,802
Manufactures of Cotton—	
Dyed, printed, and coloured,	9,000,216
White,	2,154,931
Hosiery, gloves, mits, and bindings,	1,879,783
Twist, yarn, and thread,	779,004
Nankeens, direct from China,	2,772
Articles not specified,	674,691
Silks, From India, China, &c., Piece goods,	1,738,509
Silks, Sewing silk,	50,650
Silk, sewing, from other places,	818,884
Thread and cotton lace,	1,213,672
Flaxen Goods—	
Dyed or coloured linens, checks, &c.	208,708
Other manufactures of flax,	763,079
Hempen Goods—	
Sail duck,	760,199
Other manufactures of hemp,	97,436
Hats and Bonnets—	
Leghorn, straw, &c.,	941,963
Fur, wool and leather,	14,[illegible]22
Manufactures of Iron—	
side-arms,	23,[illegible]35
Fire-arms, not specified,	203,[illegible]31
Drawing-knives,	15,[illegible]38
Cutting-knives,	14,[illegible]60
Hatchets, axes, adzes, &c.,	7,[illegible]38
Socket-chisels,	25,[illegible]60
Steelyards, &c.,	23,[illegible]36
Vises,	21,[illegible]35
Sickles, or reaping-hooks,	7,[illegible]35
Scythes,	67,[illegible]36
Spades and shovels,	17,[illegible]71
Squares of iron,	6,[illegible]37
Wood-screws,	105,[illegible]39
Articles not specified,	4,[illegible]60
Manufactures of—	
Copper,	159,[illegible]56
Brass,	235,[illegible]26
Tin,	24,[illegible]87

BANKING SYSTEM.—The Banking institutions of the United States are joint-stock companies, with fixed capitals, incorporated by the respective States; they are all banks of circulation, and their bills form the principal circulating medium of the country. Since President Jackson withdrew the charter from the National Bank of the United States at Philadelphia, the Union has been inundated with bank-notes of the value of a dollar and upwards, without any efficient machinery for regulating the exchange of them; and as New York is the centre of a vast commerce, notes of banks in every degree of credit, and whose head-quarters, where alone they are payable in specie, lie at every degree of distance, are there in circulation. The profession of bill-broker has in consequence sprung up to meet the wants of society, and appears to be at once an extensive and a lucrative employment. Pamphlets are published containing lists of all the banks in the Union and in Canada, and stating the value of their notes; and columns nearly a yard long and in small type, may be seen in some of the New York newspapers, embodying the same information. In short, it has become a science nearly as extensive and difficult as entomology or conchology to know the value of the currency of this great country.—(*Combe's Notes*, I. 26.) The over-issue of notes by so many banks has fostered speculation to an extreme degree, and placed the trade of the country on a most unstable footing; and, to aggravate the evil, most of the banks have of late suspended the payment of their notes in specie.

COMPARATIVE VIEW OF THE CONDITION OF ALL THE BANKS IN THE UNITED STATES,

Near the Commencement of each Year, from 1834 to 1840, inclusive.

	According to Returns nearest January 1.

INTERNAL COMMUNICATIONS.—Besides numerous roads of the ordinary construction, few of which are very good, lakes, and navigable rivers, the United States now possess a series of canals and railways, of which we present a condensed summary in the following table: —

A CONDENSED SUMMARY OF THE CANALS AND RAILROADS IN THE UNITED STATES; WITH THEIR LENGTHS AND TERMINATING POINTS.

Name.				*Length in Miles.*
MAINE.—*Canal*,—				
Cumberland and Oxford	*from*	Near Portland,	*to* Long Pond,	20.50
Railroad,—				
Bangor and Orono,	„	Bangor,	„ Orono,	10.00
NEW HAMPSHIRE.—*Canals*,—				
Bow Falls,	„	. . . . .	„	0.75
Hooksct Falls,	„	. . . . .	„	0.13
Amoskeag Falls,	„	. . . . .	„	1.00
Union,	„	. . . . .	„	9.00
Sewall's Falls,	„	. . . . .	„	0.25
Railroads,—				
Eastern,	„	Massachusets Line,	„ Portsmouth,	15.47
Nashua and Lowell,	„	Do. do.	„ Nashua,	5¼
Boston and Maine,	„	Do. do.	„ Exeter,	14.00
VERMONT.—*Canals*,—				
White River Falls,	„	. . . . .	„	0.50
Bellows Falls,	„	. . . . .	„	0.16
Wat:rquechy,	„	. . . . .	„	0.40
MASSACHUSETS.—*Canals*,—				
Middlesex,	„	Boston,	„ Chelmsford,	27.00
Pawtucket,	„	Lowell,	„	1.59
Blackstone,	„	Providence,	„ Worcester,	45.00
Hampshire and Hampden,	„	Connecticut Line,	„ Northampton,	22.00
Montague Falls,	„	. . . . .	„	3.00
South Hadley Falls,	„	. . . . .	„	2.00
Railroads,—				
Eastern,	„	Boston,	„ N. Hampshire Line,	38.00
Boston and Lowell,	„	Boston,	„ Lowell,	26.00
Boston and Portland,	„	Wilmington,	„ N. Hampshire Line,	20.00

Aggregate length of Canals in the United States, as stated by Mr. Tanner, . . . 3
Aggregate length of Railroads in the United States, ... 3

Remark.—The above table of the Aggregate Lengths of Canals and Railroads in the several S is compiled from "A Description of Canals and Railroads of the United States, by H. S. Ta New York, 1840;" but it will be perceived, that there is a difference, in many instances, betwe aggregate lengths here stated, and the sum of the lengths of the canals and railroads in the s States, as given in the preceding "Condensed Summary."

A number of the canals and railroads enumerated in the "Condensed Summary" are not yet pleted; and some which are not mentioned, are in progress.

DIVISIONS.—The Union consists at present of 26 States, three Territories, one Federal District. The States and Territories are subdivided into counties townships; but these are too numerous for us to specify them, nor is it very n sary; for when they are mentioned, it is always with the name of the State or t tory attached, so that there can be no difficulty in ascertaining their situation. original thirteen States which joined in the Declaration of Independence in 1776 distinguished by asterisks.

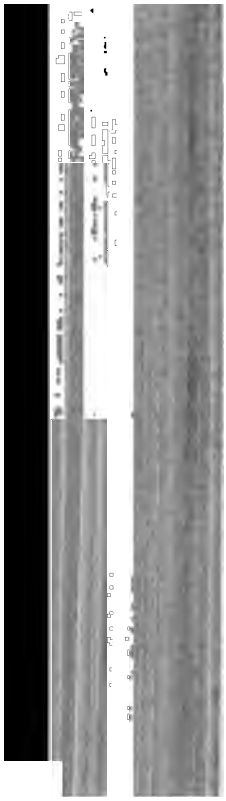
			12,866,920	2,009,031		

The States of Maine, New Hampshire, Vermont, Massachusetts, Rhode-Island, and Connecticut, forming the north-eastern part of the territory, bear collectively the name of *New England*; and their inhabitants are distinguished from other Americans by the name of *Yankees*, which is said to be an Indian corruption of *English*. They are also sometimes called the Eastern States. New York, New Jersey, Pennsylvania, Delaware, and Maryland, are called the Middle States; Virginia, the Carolinas, Georgia, and Alabama, are called the Southern States, or the South. Louisiana, Mississippi, Tennessee, Arkansas, Missouri, Kentucky, Illinois, Indiana, Ohio, Wisconsin, and Iowa, are all situate in the great Western or Mississippi valley. Michigan consists of the peninsula between lakes Huron and Michigan, and includes also the whole of the west shore of Lake Michigan and the eastern part of the peninsula between that lake and Lake Superior. Florida forms a long peninsula, projecting southward between the Gulf of Mexico and the Atlantic Ocean; the interior consists of swamps, which render a passage across it not every where nor always practicable. The district of Columbia is a small area, ten miles square, situate on both sides of the river Potomac, which was ceded by the States of Virginia and Maryland to the United States for the site of the federal capital.

§ *Cities and Towns, &c.*

DISTRICT OF COLUMBIA.—WASHINGTON, the capital of the United States of North America, is finely situate on undulating ground, in the angle formed by the junction of the navigable river Potomac with the Eastern branch, in 38° 53′ N. lat., and 77° 1′ W. long., about 80 miles from Chesapeake Bay. The plan of the city, as originally laid out, forms nearly a parallelogram of about four miles by two and a half, consisting of streets crossing each other at right angles in the direction of the cardinal points, and transversed obliquely by larger avenues, named after the several States of the Union; but only a small portion of the plan has yet been executed, and the city consists of straggling clusters of houses placed at inconvenient distances. Almost the only part that is compactly built is that which extends for about a mile along Pennsylvania avenue, between the President's house and the Capitol, both of which are handsome buildings of white free-stone. The Capitol contains the halls of the Senate and House of Representatives, the Library of Congress, and numerous other apartments, some of which are spacious and tastefully embellished. It is a large building, surmounted in the centre by a massy dome; its eastern front is adorned with a Corinthian colonnade, and surrounded by grounds tastefully planted and laid out. There are various other public buildings, of neat and substantial, but unpretending architecture, as the City Hall, the Halls of Columbian College, the Penitentiary, 20 churches, the Medical Hall, &c. About a mile S.E. of the Capitol is the Navy yard, on Eastern branch, which is of sufficient depth along shore for the largest vessels, and immediately above it is the Naval Hospital. At the junction of the two rivers stands the United States Arsenal. The principal educational establishment is Columbian College, founded by the Baptists, with nine instructors, besides four professors connected with the medical department. The city was founded in 1791, and became the seat of government in 1800; in 1830 the population amounted to 18,827, including 3129 free blacks, and 2319 slaves; but during the Sessions of Congress it is crowded with strangers. Notwithstanding its advantageous situation on a large navigable river, and in the centre of a productive country, Washington has never become the seat of trade; and its growth is to be attributed solely to the expenditure of government and the public functionaries. It has a bridge one mile in length over the Potomac, leading to Alexandria; and two bridges across Eastern Branch. The Baltimore railroad affords an easy communication with the north; the Chesapeake and Ohio canals connect it with the west; and the Potomac to different points, on which regular lines of steam-packets run, with the south. *Alexandria* stands on the Virginian side of the Potomac, about six miles below Washington,



NEW HAMPSHIRE.—Concord, the capital, is a small town on the ri
been rendered navigable by several small canals round its falls. *Portsmou*
catsqua river, which forms one of the finest harbours in the world, is a n
inhabitants, who carry on the coasting trade and fishery with some acti
branches of manufacture. It contains one of the navy yards of the Unite
largest town, is 10 miles W. of Portsmouth, and contains about 6000 inhab

VERMONT.—Montpelier, the capital, is a small town, in a wild and an
the eastern and western chains of mountains, but occupies a beautiful situ
which runs to Lake Champlain. The other principal towns are, *Burlington*
bitants, on the east side of Lake Champlain; *St. Albans*, *Swanton*, *Vergen*
Champlain; *Middlebury*, the seat of a college; *Pittsford*, *Rutland*, *Manches*
Brattleboro, which contains the Vermont asylum for the insane; *Rocking*
Norwich, the seat of a university, and *Danville*.

MASSACHUSETTS.—Boston, the capital, is pleasantly situate on
the west side of Massachusetts Bay, at the mouth of Charles river, with
harbour, possessing sufficient depth for the largest vessels, and perfectly se
also extended into South Boston on the mainland, and to East Boston on a
the north is *Charlestown*, also on a peninsula, and *Chelsea*; and to the wes
These may be all considered as one large town connected partly by bridges, a
stations, and containing altogether above 100,000 inhabitants, of whom 80,32
tion of the city in 1837. As a commercial town Boston is second only to New Y
ing to the port at the end of 1836, amounted to 226,042 tons; the value of
countries, to £3,200,000; and of exports, to £2,000,000. Boston is also distinguished for
the literary character of many of its citizens. Charlestown contains a Unit
Bunker's Hill, so celebrated for the battle fought there 17th June 1775. The
by a granite obelisk, intended to be 220 feet high, but not yet finished, which
hill. *Cambridge* is the seat of Harvard university, which is about four miles f
a permanent fund of £120,000 in property, and an yearly income of £4400, be
farther is the cemetery of Mount Auburn, in a very beautiful and pictures
miles N.E. of Boston, a considerable town, with 15,000 inhabitants, who
guished for their commercial enterprise, frugality, and industry. *Newburyp*
neatly built town at the mouth of the Merrimack, carries on a considerabl
cod, mackerel, and whale-fisheries. Population in 1837, 6741. *Lowell*, at the
mack and Concord rivers, 20 miles N.W. of Boston, with which it is conn
canal, is one of the principal manufacturing towns of the United States.
only about 100 inhabitants; in 1837, the population amounted to 18,010; and
24 cotton-mills, with 135,000 spindles and 5000 looms, besides woollen and ot
tucket, a sandy island, on the south coast, contains a population of 9000 inhabita
for their enterprise in the whale-fishery, and other maritime occupations. Fo
the dangerous shoals and breakers called the *Nantucket Shoals*. *Fall River*,
river, 45 miles S. of Boston, contains 6352 inhabitants who are largely engag
ture; and farther up the river, at the head of sloop navigation, is *Taunton*, al
with 7647 inhabitants. *Plymouth*, on the coast, 36 miles S.E. of Boston, a sma
tants, is memorable as the spot where the exiled Independents of Yorksh
pilgrim fathers," founded the first settlement in New England, 11th Decem
rapidly increasing town, with a population exceeding 7000, on the railroad.
Springfield, a thriving manufacturing town, on the Connecticut, with about
other principal towns are, *Adams*, *Williamston*, *Northampton*, *Deerfield*, an
the Connecticut; *Province-town*, at the extremity of Cape Cod; *New Bedf*
the whale-fishery, on the Acushnet, an inlet of Buzzard's Bay; *Barnstable*
stable county, the south-east part of the State; *Edgarton*, the chief town,
and capacious harbour in the island called *Martha's Vineyard*, off the south

town with 11,534 inhabitants, who are extensively engaged in several branches of manufacture and trade. It contains also the buildings of Yale College, one of the oldest and most extensively useful of the schools of the United States. The other principal places are, *Saybrook*, at the mouth of the Connecticut; *New London*, at the mouth of the Thames; *Bridgeport*, to the west of the mouth of the Housatonic river; *Birmingham*, and *Waterbury*, on the Naugatuck, and *Meriden* on the Quinipiak, which are seats of extensive manufactures, chiefly of iron, brass, tin, and copper.

NEW YORK.—The city of *New York* is the largest, most wealthy, and most flourishing in America. It occupies the southern part of Manhattan, a narrow island, 14 miles long, formed by the Hudson and the East river, and extends three miles along the bank of the former, and four along the bank of the latter river. Below the city, Long Island, Staten Island, and the mainland of New Jersey, form a land-locked bay or harbour, of easy access, sheltered from storms, deep enough for the largest ships, and sufficiently large to contain all the navies in the world. No city possesses greater advantages for foreign commerce and inland trade; two long lines of canals have increased its natural advantages, and, connecting it with the remotest west, have rendered it the great mart of a vast region, now occupied by industrious millions, while its facilities of communication with all parts of the world have made it the great thoroughfare of the continent. Its progress in population, trade, and wealth, has probably never been paralleled. In 1650, it contained only about 800 inhabitants; in 1700, 6000; in 1756, 10,381; in 1790, 33,131; in 1800, 60,489; in 1810, 96,373; in 1820, 123,706; in 1830, 202,589; in 1835, 270,089. The greater part of the city consists of streets running in straight lines, but not always parallel or crossing each other at right angles. They are well paved and well lighted, and most of the buildings are of brick, marble, or granite, although there are still many of wood. *Broadway*, the principal street, is a long and spacious avenue, three miles in length and 80 feet wide, bordered by commodious and elegant houses, and containing long rows of rich and showy shops. Here is a continual stream of carriages, waggons, drays, omnibuses, and all other sorts of vehicles destined for business or pleasure, and crowds of pedestrians sauntering or hurrying along. The southern point of the island, on both sides of Broadway, is the principal seat of business, and the banks of both rivers are lined with forests of masts, bearing the flags of all countries. *Wall* street, occupied by bankers and brokers, is the centre of money transactions. At present the inhabitants are imperfectly supplied with water by wells, cisterns, and some small aqueducts; but measures are in progress for bringing into the city, by an aqueduct 41 miles in length, such a quantity of water as will afford a daily supply of thirty millions of gallons. This great work will cost £1,000,000 sterling. Among the public buildings may be mentioned, the City Hall, a handsome edifice, in the Park, near the southern part of the city; the Hall of the university, in Washington square; the New York Hospital; the Custom-house; the merchants' exchange, in Wall Street; the halls of justice, or collect prison, a massive building in the Egyptian style; Astor house, in Broadway, a hotel, built of granite, containing 390 rooms, and furnishing 600 beds; the alms houses at Bellevue, on East river; and 160 churches, &c. The churches are more distinguished for their accommodation and comfort than for size and splendour; nor are the other public buildings either so numerous or so striking as in the cities of Europe. Of places of public amusement there is a great number, including six theatres, which are well filled every night. The civil or municipal government is vested in a mayor, aldermen, and common council, elected annually by universal suffrage and the ballot; whose jurisdiction extends over the city and the surrounding waters. The offices are not largely paid, nor accompanied by much patronage; and the occupants of civic offices are seldom considered as thereby invested with much additional dignity. But it is chiefly as the great mart of foreign commerce and inland trade that New York is distinguished. In 1786 the whole shipping of the port did not exceed 120 in number, with a tonnage of 18,000. In 1836, it consisted of 2293 vessels, of which there were 599 ships, 197 barques, 1073 brigs and galleys, 412 schooners, and 4 sloops; with a burden of 350,000 tons. In 1791, the whole amount of the exports was £501,093; in 1816, only twenty-five years later, the mere duties on merchandise imported at New York alone, amounted to £3,200,000; and in 1836, the value of the exports amounted to £25,732,600; and of imports, to £37,996,007; but these were much above the ordinary amount, the importations of that year being excessively great. The inland and coasting trade is immense; but of its actual extent and value there is no account. Near the northern end of Manhattan is the village of *Harlaem*, connected with the city by a railroad, six miles in length; and on Long Island, opposite New York, stands the city of *Brooklyn*, with a population of 30,000; to the north-east of Brooklyn is *Williamsburg*, another suburb of the great emporium; and on Wallabout bay, lying between these, is the United States' navy yard. Nine steam-boats at four ferries keep up a constant communication with New York, and a railroad runs eastward through Long Island to Hicksville, a distance of 27 miles.

Albany, the capital of the State, is pleasantly situate on an eminence on the western bank of the Hudson, 144 miles above New York. Its wealth and trade have been greatly increased by the opening of the Erie and Champlain canals, which terminate in a large basin within the city; and its situation renders it the great thoroughfare for travellers on the northern and western routes. The Hudson and Mohawk railroad, which is a prolongation of the Saratoga and Utica railroads, also terminates here. The number of travellers who pass through the city yearly exceeds 600,000; the total number of boats which arrived at and departed from Albany, in 1836, was 10,226; to which must be added about 400 coasting vessels. Several iron works, breweries, tanneries, and other manufactories, add to the wealth of this thriving city. Population in 1835, 28,109. *Hudson*, on the left bank of the river at the head of ship navigation, 117 miles from the sea, is a prettily situate, and well-built town, with an extensive and increasing trade, and a population, in 1835, of 5531. To the north-west is the village of *New Lebanon*, a favourite watering-place, in a delightful situation; with warm springs, and in the vicinity of the springs is a society of Shakers, consisting of about 600 members. *Catskill*, below Hudson, on the opposite bank, is a large village with 5000 inhabitants. At *Sing-Sing*, on the left bank of the Hudson, 35 miles above New York, is the state prison for criminals, and at *West Point*, 12 miles further north, but on the right bank, is the academy where the officers of the United States' army are educated. *Newburgh* and *Pooghkeepsie*, farther up the river, the former on the right, and the latter on the left bank, are two of the most flourishing towns in America. They contain each a population of 10,000, which is rapidly increasing. *Troy*, on the east bank of the Hudson, six miles above Albany, a well-built town with regular and spacious streets, on the alluvial flat of the river, has become the seat of an active trade: and there are numerous manufactories and cotton-mills in the neighbourhood. Population in 1835, 16,959, besides 3300 in the village of West Troy, on the opposite bank of the river. Troy is situate at the head of the tide and sloop navigation, and is connected by canals with the lakes to the north and west. *Lansinburg*, above Troy, with 3000 inhabitants, is a busy place, largely engaged in the river trade, and contains a great number of manufactories and workshops. N.W. of Troy, 20 and 24 miles, are *Ballston Spa* and *Saratoga Springs*, two celebrated watering places, much frequented in summer; and to the north of these are two places celebrated in the wars of last century, *Ticonderoga*, at the outlet of Lake George, and *Crown Point* on Lake Champlain. *Plattsburg*, a flourishing village, also on Lake Champlain, acquired some notoriety during last war for the capture of a British flotilla and the defeat of a land force. These places are situate in Essex and Clinton counties, which contain 222 saw-mills, and 51 iron-works, besides tanneries, pot and pearl asheries, cotton-factories, &c. *Ogdensburg*, on the St. Lawrence, at the mouth of the Oswegatchie, and opposite

to Prescott in Upper Canada, is advantageously situate at the lowest point to which lake steamers navigate the river. It is a port of entry, and has a population of 2000. *Sackett's Harbour*, at the east end of Lake Ontario, is spacious and safe, with depth of water sufficient for the largest ships close along the shore. It was the naval station during last war, and has barracks for the accommodation of 2000 troops. It is a port of entry; has considerable trade, and about 1800 inhabitants. Ten miles from the lake or Black river, which falls into Sackett's harbour, is *Watertown*, a large and rapidly increasing village, with 3500 inhabitants, most advantageously situate for mills, the river having a fall of 90 feet within the space of a mile. *Schenectady* is a flourishing town on the banks of the Mohawk, intersected by the Erie canal, and by railroads from Albany to Saratoga and Utica, and increased its population from 4268, in 1830, to 6272 in 1835. *Little Falls*, on the Mohawk river, is most advantageously situate for the employment of machinery, and has a population of 2000. *Utica*, on the southern branch of the Mohawk, at the junction of the Chenango and Erie canals, is a rapidly increasing town, having doubled its population in the ten years preceding 1835, when it amounted to 10,183. About 15 miles N.N.E. of Utica are *Trenton Falls*, on the West Canada creek, an affluent of the Mohawk, which are much visited on account of their picturesque scenery. *Rome*, at the junction of the Erie canal with the Mohawk, has already about 2000 inhabitants, and has the prospect of becoming a place of considerable importance. *Oswego*, one of the most flourishing towns in the State is situate on Lake Ontario, at the head of the Onondaga or Oswego river. It is the chief commercial port on the lake, and its trade has been vastly increased since the opening of the Welland canal, which has made it the centre of much of the trade of the upper lakes. Population in 1835, 5000. *Salina*, a village in Onondaga county, 30 miles S. by W. of Oswego, contains a great salt-spring, from which large quantities of salt are made. Salina contains 2500 inhabitants, 77 salt-works, with 1968 kettles and pans. *Syracuse*, a mile distant, is increasing so rapidly that the two villages will probably soon become united into one large town. *Seneca Falls*, at the outlet of Lake Seneca, is one of the most prosperous villages in the State, having increased its population in the ten years preceding 1835 from 253 to 3500. It owes its rapid growth to the water-power furnished by the river, which is estimated to be sufficient for 200,000 spindles. *Waterloo*, several miles further up the river, participates in the advantages, and rivals the growth of Seneca Falls; it contains a population of 2000, with a great number of flour, saw, and other mills, and is noted for its wooden-ware. *Geneva*, an old town in this region of new cities, is the seat of a college, and contains 3000 inhabitants. It occupies a beautiful site, at the north end of Seneca lake. *Canandaigua*, at the north end of a fine lake of the same name, rivals Geneva in the beauty of its situation, and the elegance of its houses, is a more busy town, and contains 2000 inhabitants. *Penn-yan*, on the Crooked lake canal, a thriving manufacturing village, with 1500 inhabitants, derives its singular name from the circumstance of its having been founded by about an equal number of Pennsylvanians and Yankees. *Rochester*, on the Genesee and the Erie Canal, a most rapidly increasing town, whose population increased from 1500, in 1820, to 17,160, in 1837. It is well built, with spacious streets, and carries on a great trade in wheat and flour, as well by the canals as by the lakes, the steamers of which ascend the river to its port of *Carthage*. Its carpet manufacture has attained high excellence. Other branches of the woollen trade, and various other manufactures are also very flourishing. *Lockport*, a flourishing town, situate at the place where the Erie canal rises from the Rochester level to that of Lake Erie, by means of five double locks, was founded in 1821, and in 1837 contained about 5000 inhabitants. *Buffalo*, the great emporium of the lakes, is situate at the point where the Erie canal joins the lake of that name, at the head of the Niagara river; and increased its population from 2095, in 1820, to 20,000 in 1837. It is a well built town, with spacious streets, and neat and commodious buildings. A railroad extends from Buffalo to the Falls of Niagara; and another, 3 miles in length, connects it with the flourishing village of *Black Rocks*, which has 2000 inhabitants, at the entrance of the canal. *Schlosser*, a small place with a harbour, formed at the mouth of Gill Creek on the Niagara river, just above the falls, opposite the Canadian village of Chippeway. *Auburn*, a village at the outlet of Lake Owasco, contains the western penitentiary of the State, which has 600 cells, and spacious work-shops. The establishment is managed on the principle of solitary confinement by night; but the prisoners work and eat together during the day. One of the most remarkable objects in the State of New York is the *Erie canal*, which extends from the Hudson at Albany, to Lake Erie at Buffalo, a distance of 363 miles, which was commenced in 1817, and completed in 1825, at the expense of about £2,200,000 sterling. The trade on the canal is already very great, and is every year increasing, so much so, that by a recent act of the legislature, its breadth is to be increased from 40 feet to 70, and its depth from 4 to 6, with a double set of locks, at an expense of £2,000,000 more. The State of New York also includes Long-Island, which extends 120 miles eastward from the city, being 20 miles broad, and is traversed by a range of low hills.

NEW JERSEY.—*Trenton*, the capital, at the lower falls of the Delaware, is a small town, with only 3925 inhabitants. *Princeton*, 10 miles N.E. of Trenton, is noted in the history of the revolutionary war, and contains the halls of New Jersey College, and a Presbyterian theological seminary. *Newark*, the largest and most important town in the State, stands on the river Passaic, 3 miles from Newark Bay, and 10 miles west of New York. It contains numerous manufactures of various kinds, and 20,000 inhabitants. *Paterson*, one of the most important towns in the United States, stands on the Passaic at its lower falls, and contains numerous manufactures, for which it possesses water power equal to 1750 horses. Its population increased from 7731 in 1830, to above 12,000 in 1836. Paterson communicates with the Hudson by a railroad. *Jersey City*, formerly *Paulus Hook*, stands on Berren Peninsula, opposite to New York, on the right bank of the Hudson, where the river is a mile wide, and at the eastern termination of the Morris Canal, and the Paterson and New Jersey railroads. It is a rapidly improving town. A few miles up the river is the village of *Hoboken*, a famous summer resort, and the battle field of the New York duellists. The other principal places are: *Elizabethtown*, four miles from Newark Bay; *Bridgetown*, a little further south; *Perth Amboy* and *South Amboy*, at the mouth of the Raritan river, to the south-west of Staten Island; *New Brunswick*, at the head of sloop navigation on the Raritan, and at the termination of the Delaware and Raritan Canal, with 6000 inhabitants. *Morristown*, where Washington fixed his head-quarters in the winter of 1779; *Bordentown*, on the Delaware, below Trenton; *Burlington*, further down the river, and *Camden*, a busy thriving place opposite to Philadelphia.

PENNSYLVANIA.—*Philadelphia* is situate on a plain, between the rivers Delaware and Schuylkill, extending about five miles N.-S. along the former, and two miles E.-W., being built on a very regular plan, with spacious streets crossing each other at right angles, which are lined with good houses, mostly built of red brick, and planted with rows of trees. Though 100 miles from the sea, it has not only all the advantages of a maritime station, but also those of a double port; for the Schuylkill is accessible to vessels of 300 tons, while the Delaware which is here one mile wide, admits the largest merchant vessels to the doors of the warehouses, and is at once spacious and secure. The population, in 1830, amounted to 167,836; it now exceeds 200,000. The manufactures are various and extensive, and the foreign commerce is considerable, though inferior to that of New York; but the inland and coasting trade is extensive and is rapidly increasing. The city is noted for the number and excellence of its benevolent and literary institutions; and among its public buildings may be mentioned, the Old State House, in which the declaration of independence was signed in 1776; the United States Bank; the Pennsylvania Bank; the United States Mint; and Girard College, a magnificent building erecting according

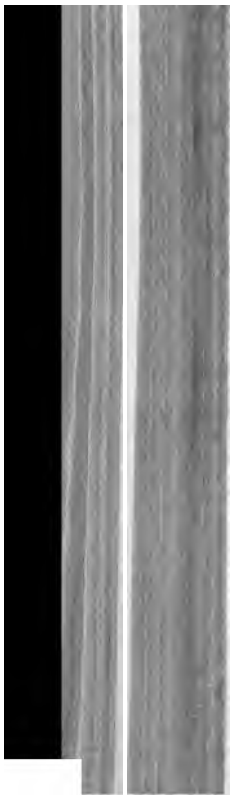
to the bequest of M. Girard, a banker in the city, who left his fortune of £1,500,000 for the purpose of educating orphan children. Philadelphia was founded by William Penn in 1682, who gave it its present Quaker-like name, which means brotherly love.

Harrisburg, the capital of the State, is situate on the left bank of the Susquehanna; but is a small town, with less than 5000 inhabitants. *Pittsburg* is situate on a low alluvial point at the junction of the Alleghany and Monongahela rivers, extending about a mile and a half along the former, and one mile along the latter. Perhaps the site is unrivalled in the world; commanding a river navigation of about 20,000 miles, which gives it access to the most extensive fertile region on the globe, as well as to the sea; surrounded by inexhaustible beds of the most useful minerals; connected by canals and railroads with the principal commercial marts of the Atlantic coast, and by others with the great lakes. The population in 1800 was only about 1600; in 1837, including that of its suburbs of Alleghany, Lawrenceville, and Birmingham, 36,000. This astonishing increase is owing to the rapid growth of the manufacturing establishments. In 1833 there were 90 steam-engines at work, and in 1836, there were 125; 10 rolling-mills, 19 iron-foundries, machine-shops, and steam-engine factories, 10 glass-works, 8 cotton-factories, besides numerous other establishments, as breweries, tanneries, brass-foundries, smitheries, saw-mills, oil-mills, grist-mills. The value of their annual produce is estimated at £2,500,000; about 250,000 chaldrons of coal are annually raised in the neighbourhood; the trade is extensive; and the amount of the mercantile transactions, in 1837, was estimated at £3,775,000. The city is regularly built, but the clouds of smoke, in which it is constantly enveloped, give it rather a dingy appearance. The suburb of Lawrenceville contains the Alleghany arsenal of the United States. The other principal places are: *Reading*, on the Schuylkill, with 8000 inhabitants; *Chester*, on the Delaware below Philadelphia, 1000; *West-Chester*, in the fine valley of the Brandywine, 1500; *Lancaster*, 64 miles west of Philadelphia, 7704 inhabitants, chiefly Germans, or of German descent; *Easton*, on the Delaware, 5000; *Hamburg*, on the Schuylkill 3500,; *Carlisle*, on the Conedogwinit, 3707; *Pottsville*, on the Schuylkill, whose population had increased from 300 in 1825 to 3300 in 1835; *Wilkesbarre*, on the Susquehanna, in the vale of *Wyoming*, 3000; *Erie*, a small but thriving town, with one of the best harbours on the lake of the same name, at the termination of a railway which connects it with the Alleghany.

DELAWARE.— *Dover*, the capital, is a small town with 1500 inhabitants, near the centre of the State, 7 miles west from the shore of the Delaware. *Wilmington*, the principal and only considerable town, stands on a narrow neck of land between the Christina Creek and the Brandywine, just above their confluence, a few miles from the Delaware. It is a busy and prosperous place, with upwards of 10,000 inhabitants. There are about 100 mills and factories in the immediate neighbourhood, which produce flour, paper, gunpowder, ironware, cotton, and woollen goods, and the city is itself the seat of some branches of mechanical industry. *Newcastle*, an old town, with a harbour on the Delaware, at the termination of a railway which leads to Elk river, on the Chesapeake. *Port Penn*, opposite Reedy Island on the Delaware, is a convenient shelter for vessels when the river is obstructed with ice.

MARYLAND.—*Annapolis*, the capital, is a small scattered town, of about 2500 inhabitants, on the west bank of the Severn river, near the Chesapeake. *Baltimore*, a large and flourishing commercial city, on the Patapsco river, an arm of the Chesapeake, 37 miles N.E. of Washington, and 200 miles from the sea by the ship channel. It has a capacious harbour, where 2000 vessels may lie in safety, and an inner basin, where vessels drawing 10 or 12 feet may approach the quays. Baltimore is a well built town, with broad, straight, and regular streets, and in 1830 contained 80,625 inhabitants. It formerly possessed a great foreign trade, which has now been considerably diverted to New York and Philadelphia; but the coasting trade has been much extended. The shipping belonging to the port in 1836, amounted to 62,365 tons, one-half of which was engaged in the coasting trade. The manufacturing industry of Baltimore has, of late years, received a great impetus, and has now become important for its extent; within 10 miles of the city there are about 70 manufacturing establishments; and the Baltimore shipbuilders are famed for the construction of fast-sailing vessels, which are in demand in foreign ports. The city is well supplied with water, and, though formerly considered unhealthy, and repeatedly suffering from the ravages of the yellow fever, is now one of the healthiest cities in the Union, owing probably to the draining of the marshes and the paving of the streets. *Frederick*, a flourishing town, with 7000 or 8000 inhabitants, on a branch of the Baltimore and Ohio railway. *Cumberland*, in the western part of the State on the Potomac, at the eastern terminus of the great national road, has lately become important from its valuable coal seams, which are rendered accessible by the Chesapeake and Ohio Canal.

VIRGINIA.— *Richmond*, the capital, is pleasantly situate on the left bank of the James river, below its lower falls, about 100 miles south of Washington. Including Manchester on the opposite side of the river, and connected with it by a bridge; the population exceeds 20,000. The Capitol, or State-house, though occupying a commanding situation, is only a large brick building, on the model of the Maison Carrée of Nismes. Richmond is 110 miles from the mouth of the river, which has 14 feet of water up to Warwick, 5 miles below the city, and is navigable for boats 220 miles above the falls. This advantageous position enables it to carry on an extensive trade; and the annual value of its exports is estimated at £600,000. *Petersburg*, now a thriving manufacturing town, on the Appomatox river, with 8330 inhabitants in 1830, is connected by a railroad with Richmond on the north, and the Roanoke on the south. *City-point*, a mere hamlet at the confluence of the Appomatox with the James, has a deep and spacious harbour, where wharfs have been built for loading such large vessels as cannot go up to Richmond or Petersburg. *Norfolk*, on Elizabeth river, 8 miles from Hampton roads, near the entrance of the Chesapeake, is a considerable town with about 12,000 inhabitants, including those of the suburbs of Portsmouth and Gosport, which contain one of the principal naval stations and depots of the United States. *Hampton roads*, below Norfolk, and within the mouth of James river, are protected by *Fort Monroe*, on Old Point, a formidable fortress, designed to mount 412 cannon; and on the opposite point, named the Rip-raps, and 1900 yards distant, is *Fort Calhoun*, which is capable of mounting 232 guns. To the south of Norfolk is the *Dismal Swamp*, containing about 150,000 acres, in some places covered with a dense growth of large trees, cedars, cypresses, or pines, and in others bearing only tall reeds and grasses. The soil is in some places a soft trembling bog, in others firm, but covered knee deep with water; and in the centre is Lake Drummond, about 20 miles in circumference, with a depth of 12 or 15 feet. It is now crossed by a canal which carries its timber to Norfolk. *York town*, at the mouth of York river, near the Chesapeake, is celebrated in the history of the revolutionary war, for the surrender of Lord Cornwallis and his army, which took place here in October 1781. *Williamsburg*, once the capital of the province, is now a decayed town, about midway between the York and the James. *Mount Vernon*, on a high bank of the Potomac, 7 miles below Alexandria, once the seat of Washington, now contains his tomb, which is merely a brick vault in the garden. *Fredericksburg*, a thriving town, at the head of the navigation on the Rappahannock. *Monticello*, 64 miles W.N.W. of Richmond, formerly the seat of President Jefferson, contains his tomb, which is marked with a simple granite obelisk. *Charlottesville*, the seat of the University of Virginia, near Monticello, is a small town with less than 1000 inhabitants, of whom one-half are blacks. *Lynchburg*, one of the greatest tobacco markets in the country, is situate on the James, and in 1830 contained 4630 inhabitants. In *Rockbridge* county



nually about 3,000,000 bushels of salt.

NORTH CAROLINA.—Raleigh, the capital, is a thriving town
nected by a railway with Richmond in Virginia. *Wilmington*, 26 miles
river, is a thriving commercial town, with 4000 inhabitants. *Fayetteville*
gation, on the same river, is a busy and flourishing town, with 3000 in
right bank of the Neuse, 80 miles from Pamlico Sound, is a well bu
trade, and 3762 inhabitants in 1830. *Beaufort*, on Newport river, a few
best harbour in the State, a little to the west of Cape Lookout, from whi
10 miles into the sea.

SOUTH CAROLINA.—Charleston stands on a point of land at the
Cooper rivers, six miles from the sea. The site is almost a dead level, c
high water-mark, and is subject to inundation when the sea is driven in
built on a regular plan, and contained in 1830, 30,289 inhabitants. The
and the bar forms an almost continuous line of breakers extending abou
Moutinerille, on Sullivan's Island, is a pleasant little town, much resorted
when the refreshing sea breezes restore health and vigour to the system
some air of the swamps. *Georgetown*, on Winyaw Bay, a place of some
is situate among swamps, and very unhealthy. *Columbia*, the capital o
Congaree river, is only a small town, with 4000 inhabitants. *Hamburg*, o
Augusta, in Georgia, is the most flourishing town in the State. The fi
1821, and, at the end of six years, the population exceeded 1000, and i
number. It stands at the head of steam navigation on the river, and is
by a railroad. *Spartanburg*, a pleasant village, with 1000 inhabitants, 185 m
ton. To the north of it is *Cowpens*, the scene of an engagement in the re

GEORGIA.—Milledgeville, the capital, is a small town, on the Oconee r
Savannah, a flourishing commercial town, containing, in 1835, 11,000 inha
bank of Savannah river, 15 miles from the sea, but is accessible to large v
the Savannah, at the head of steam-boat navigation, 240 miles above the
well built and thriving commercial town, with about 8000 inhabitants.
contained in 1823 only a single cabin; in 1836 the population had increa
pot of a populous and fertile country, and has an extensive trade. *Colum*
river, 430 miles from the Gulf of Mexico, by the windings of the stream, w
in 1836 had already acquired a population of 4000 souls. Steamers run reg
carry thither the produce of this inland region.

ALABAMA.—Tuscaloosa, the capital, is a small but thriving town, with
centre of the state. *Mobile*, at the mouth of the great river of Alabama, ha
tensive trade; about 250,000 bales of cotton are annually shipped from its w
which in 1830 was only 3194, had increased in 1836 to nearly 10,000. *St. Step*
a flourishing town with 12,000 inhabitants. *Montgomery*, near the head of
ous town with 2000 inhabitants. *Wetumpka*, five miles above the junct
Tallapoosa, stands at the head of steam navigation on the former; it was l
contained 3000 inhabitants, having become the depot of a highly fertile
head of steam navigation on the river Tennessee, below the muscle shoal
2000 inhabitants. *Waterloo*, lower down, is at the head of navigation durin
when steam-boats cannot pass Colbert's shoals. Above the Muscle shoals
the river, with which it is connected by a canal, is *Huntsville*, the princip
thern Alabama. It is surrounded by a fertile, populous, and well-cultivat
2500 inhabitants.

MISSISSIPPI.—Jackson, the capital, is a small town newly laid out, w
[illegible] and about 1000 inhabitants. Natchez, on the

Vicksburg. *Columbus*, on the Tombigbee, at the head of the ordinary steam navigation, contains about 3000 inhabitants.

LOUISIANA.—New Orleans, the capital, is situate on the left bank of the Mississippi, 100 miles from its mouth, but only 15 from the bay called Lake Borgne, and four from Lake Pontchartrain. Steam-boats and coasting vessels come up to the landing-place on the latter, where an artificial harbour has been formed, and from which a railroad and two canals extend to the city. In front of the city, on the river, the largest merchant-ships lie close along the shore, and discharge and receive their cargoes by means of a moveable platform adapted for the purpose. The river is about 160 feet deep, and about half a mile wide. The city is built on a flat of soft and marshy ground, declining from the river to the swamps in the rear, which, spreading all round, emit noxious exhalations during the hot season, and render the place a dangerous residence to strangers. The older part of the city consists of narrow streets, with old-fashioned French and Spanish houses, most of them only one storey high, and built of wood; but in the newer quarters tall brick-houses, in the American style, are most common. The population in 1836 amounted to about 70,000, who display the greatest variety in manners, language, and complexion. French and Spanish creoles are mingled with immigrants from all parts of the Union, from various countries of Europe, and with coloured persons of every shade. But the police is efficient and vigorous, and disturbances or acts of violence are rare. New Orleans is the emporium of the whole valley of the Mississippi. Thousands of huge arks and rafts float down the mighty stream for thousands of miles, loaded with the produce of the country. From 1500 to 2000 flat boats, from 50 to 60 steamers, and a forest of masts of sea-going vessels, are often to be seen at once along the levee, which protects the city from the river. The whole value of commercial transactions during the year probably exceeds £16,000,000 sterling. The banks of the river for 50 miles below the city are covered with sugar plantations; and a little lower down, at Plaquemine bend, the approach is defended by *Forts Jackson* and *St. Philip*. Below these there are no settlements, except at the little hamlet of *Balize*, 4 miles within the bar, occupied by a few pilots. The State contains no other important towns; but it possesses a great number of thriving villages, among which we may mention *Alexandria*, on the Red river, and *Natchitoches*, on the same river, 90 miles above it, and 190 from the Mississippi, with a population of 2500.

TENNESSEE.—Nashville, the capital, and chief commercial town, is situate on the left bank of the Cumberland river, in a highly picturesque and fertile country. It is a neatly-built town, with about 8000 inhabitants, and carries on an extensive trade. *Knoxville*, in East Tennessee, has a population of 2000, and is a place of considerable trade. *Memphis*, on the Mississippi, is a rapidly increasing town; and three miles below it the city of *Giran* has been founded. There are no other towns in the State, but a number of thriving villages.

KENTUCKY.—Frankfort, the capital, a small town with 2000 inhabitants, stands on the right bank of the Kentucky river, 70 miles from its mouth. *Louisville* is situate above the falls of the Ohio, and is a rapidly-increasing and well-built town with 25,000 inhabitants, various and extensive manufactures, and a great trade. The falls are only perceptible at low water; at other seasons they present no serious obstruction to navigation; but at all times the Louisville and Portland canal enables large steam-boats to reach Louisville. Below the falls are the villages of *Shippingport* and *Portland*, with good harbours. *Lexington*, one of the oldest towns, and formerly the capital of the State, is a spacious well-built town, with 6000 or 7000 inhabitants, 70 miles E. of Louisville, with which it is connected by a winding railroad. Kentucky contains, besides, a number of thriving villages.

OHIO.—Columbus, the capital, a regularly laid out and well-built town, on the Scioto, near the centre of the State, with about 5000 inhabitants. *Cincinnati*, a large city on the right bank of the Ohio, has grown with the most astonishing rapidity to its present extent and importance. It was founded in 1789; in 1800, its population amounted to 750; in 1820, to 9642, in 1830, to 24,831; and in 1836, was estimated to exceed 32,000, or, including Newport and Covington, 36,000. It is built on a very regular plan, with many elegant houses and public buildings; and has become the seat of large and numerous manufacturing establishments, and of an extensive trade, particularly in the article of pork, so many as 160,000 swine being slaughtered here in a year, besides what is brought from other places. *Cleveland*, on Lake Erie, at the mouth of the Cuyahoga creek, in a plain, 80 feet above the level of the lake, with spacious and regular streets, neat buildings, and 6425 inhabitants in 1837. The town is rapidly increasing, and promises to rival or even to take the precedence of Buffalo, owing to the lake in this quarter becoming sooner clear of ice. Cleveland has a safe and commodious harbour; and on the opposite side of the creek is *Ohio city*, a growing village, with 2000 inhabitants. *Fairport*, *Astabula*, *Conneaut*, and *Huron*, towns on the lake, with harbours. *Sandusky city*, on the southern shore of Sandusky bay, has a population of 2000, and is connected by a railroad with Monroeville and Tiffin. *Toledo*, a growing place, whose situation, at the mouth of the Maumee, will enable it to command the trade of north-western Ohio, north-eastern Indiana, and south-eastern Michigan. Its trade is already important. The village of *Manhattan*, three miles below, has been fixed on as the terminus of the Wabash and Miami canals. *Perrysburg*, higher up the river, is also advantageously situate, and may become a formidable rival to Toledo. *Hamilton*, on the Miami, is a busy prosperous town with 2500 inhabitants; and higher up is *Dayton*, with 3800. *Springfield*, on the Mad river, a rapidly-increasing, manufacturing, and commercial town, which doubled its population between 1830 and 1836; in which latter year it contained 2317 inhabitants.

INDIANA contains no large towns, but only a number of thriving villages; though one of them, *Madison*, on the Ohio, is advancing so rapidly as to have trebled its population in six years, the number of inhabitants in 1737 being about 4000. *Indianapolis*, the capital, stands on a beautiful plain, at the confluence of Fall creek with White river; but contains only about 2500 inhabitants. *New Albany*, below the falls of the Ohio, shares in the prosperity of Louisville, and contains already above 4000 inhabitants, with a considerable trade, several iron and brass foundries, &c.

ILLINOIS.—The towns of Illinois are small, but some of them are rapidly growing in importance, and there is, besides, a great number of thriving villages. *Springfield*, the capital, is situate near the centre of the State, and has a population of 2000. Along the Ohio are *Shawneetown*, *Golconda*, *Napoleon*, *Trinity*, *Cairo*; along the Mississippi, downwards, *Galena*, *Savanna*, *Fort Armstrong*, *Stevenson*, *Rockport*, *New Boston*, *Oquaucka*, *Appanooce*, *Commerce*, *Montebello*, *Warsaw*, *Quincy*, *Gilead*, *Milan*, *Grafton*, *Alton*, *Kaskaskia*; on the Illinois, *Juliet*, *Dresden*, *Marseilles*, *Ottawa*, *Hennepin*, *Peoria*, *Pekin*, *Beardstown*, *Erie*, *Rushville*, *Meredosia*, *Naples*, *Carrollton*, *Augusta*; on the Wabash, *Darwin*, *Palestine*, *Mount Carmel*; *Oregon city* on Rock river. *Chicago*, on lake Michigan, is the largest town in the State. In 1832 it contained only 250 inhabitants; in 1837, its population amounted to 8000. It stands at the point of the lake which makes the nearest approach to the Mississippi, and must necessarily become a great commercial station, as the adjoining country becomes more populous.

MICHIGAN.—Detroit, the capital, is neatly and regularly built on the west bank of Detroit river, and is becoming a place of great importance. In 1830 the population was 2220; in 1837, 8323. *Monroe*, 3 miles from the head of lake Erie, on the river Raisin, which is accessible for the largest lake

IV. *TEXAS.*

TEXAS or TEJAS (See note to page 531) formed one of the states of the Mexican confederation till 1835, when General Santa-Anna having violently dissolved the confederation, and established a central government in its stead, the Texians declared themselves independent, and successfully resisted his efforts to subdue them. They now claim not merely the old Mexican province, but the whole country between the south-western boundary of the United States and the Rio Bravo del Norte, from its source to the sea, being altogether an area of about 440,000 square miles, and extending about 400 miles along the north-western shore of the Gulf of Mexico. The surface along the shore, and to the distance of from 50 to 100 miles inland, is low and level, with occasional swamps and marshes, but is generally composed of arable prairie traversed by lines of wooded river bottoms. Above this low maritime plain the country becomes moderately undulating, no where attaining any considerable elevation, but is agreeably diversified by gracefully rounded swells, gentle slopes, and broad plains. This region is mostly prairie, or unwooded land, the trees being chiefly confined to the river valleys, and to scattered clumps, which rise, like islands, in the midst of a wide grassy expanse. These fine natural pastures were formerly filled with large herds of buffaloes or bisons, and droves of mustangs or wild horses, which have now been almost entirely exterminated or driven farther north. On the west several outlying ridges of the Sierra Madre, or great Mexican cordillera extend, around the heads of the rivers Nueces and Guadalupe, across the Colorado to the Brazos, where they subside into the elevated plains of Northern Texas. In the north-west are spread out vast unwooded plains, over which the wild native Indians still roam. The coast contains no good ship harbours, and but few inlets even for the smaller class of vessels. The spacious but shallow bays which receive most of the rivers, and the mouths of those rivers which enter the Gulf immediately, are barred by shifting sand-banks, the channels through which are often intricate, and rarely have more than 8 or 10, never more than 12 or 13, feet of water. From April till August, however, ships may ride at anchor securely on the coast in 6 or 8 fathoms; but during the rest of the year the heavy swell renders that impossible.

The climate may be described generally as mild, agreeable, and healthy. The maritime plain is, however, comparatively unhealthy, though fanned by the sea breeze during half the year. Scarcely any rain falls between March and November, and the vegetation often suffers from droughts. In November north winds from the mountains set in, and heavy rains begin to fall. These winds blow, with little deviation or intermission, during the months of December and January, when the mountains are covered with snow, and the cold is sometimes severe; but snow seldom lies long in the lower districts. In the early spring the rains are very copious. The live-oak is found of large size in the maritime region, chiefly between Galveston and Matagorda Bays; the white, red, post, and Spanish oaks, the cottonwood, ash, elm, and sycamore or buttonwood, the black walnut, hickory, pecan, locust, muskit, how wood, wild cherry, mulberry, persimmon, &c., are among the native productions of the forests. Between the Colorado and the Brazos are extensive cane brakes; almost every variety of grape is found growing spontaneously in many places; and it is believed that the most valuable grapes of Europe may be advantageously introduced. The soil and climate are favourable to the growth of the sugar-cane, indigo, vine, tobacco, rice, maize, sweet potatoes, and, in some parts to the cultivation of wheat, rye, oats. The prairies afford excellent pasture all the year round.

In 1821, Stephen Austin, an American citizen, obtained a grant of land in Texas from the Mexican Government. This was followed by other grants to him and to other persons, and, since the declaration of independence, a constant tide of immigration has set into Texas, and the Anglo-American population of the State is estimated already to exceed 200,000. About 70,000 or 80,000 Mexicans are also resident within the limits, but chiefly along the banks of the Rio Grande. The Indians are estimated at 30,000; while the total number of negroes is stated by some to be only 6000, but by others, more than 10,000. Since the defeat and capture of Santa-Anna, in April 1836, the republic has enjoyed uninterrupted repose, and its independence has been acknowledged by the United States, France, Holland, Belgium, and Great Britain. The constitution of the government is framed on the democratic principles prevalent in the United States; but as the territory is regarded as a single State, the constitution is more simple, and the government more efficient than the federal government of their neighbours. The first congress elected under the provisions of this constitution assembled in September 1836, and General Samuel Houston was elected the first president of the republic. A sound administration of justice has been established; schools and colleges have been founded; public buildings have been erected; the different parts of the country have been connected by roads, and by the improvement of the natural means of communication along the rivers.

The seat of Government has been established at *Houston*, a town of great and growing importance, situate at the head of Buffalo-bayou, a sort of creek or river, which runs into the north-western corner of Galveston Bay. It has sprung up with astonishing rapidity, and is already the centre of an extensive trade. The other principal towns are, *Nacogdoches*, *St. Augustine*, *Brazoria*, *Columbia*, *Marion*, *San Felipé d' Austin*, *Washington*, *Bastrop*, and *Sant' Antonio de Bexar*. Galveston Island stretches along the Gulf of Mexico for about 30 miles, opposite to the entrance to Galveston Bay. On the eastern part of it is laid off the site of the *City of Galveston*, which, though not central to the seaboard of Texas, may be made, by means of railroads of moderate extent, the depot for the produce of the most fertile sections of the country, and will probably become in consequence its principal commercial station.

(*Article Texas in Bradford's Atlas; History of the Revolution in Texas; with the latest geographical, topographical, and statistical Accounts of the Country, by the Rev. C. Newell.* New York, 1838, *Texas; its Rise, Progress, and Prospects; by William Kennedy*, 1841.)

V. *MEXICO or MEJICO.*

(*See Note to page* 531.)

This republic or confederation occupies the narrow tract of country between the Gulf of Mexico and the Pacific Ocean, from the 15° to the 33° N. lat., being about 1700 miles in length, with a breadth varying from about 140 miles at the south to 750 at the north, and including an area of about 1,230,000 square miles. The surface is extremely varied; the country is traversed through its centre by the great cordillera or central mountain chain of North America, which not only forms a complete watershed between the Atlantic and the Pacific Oceans, but also divides into two branches enclosing between them an elevated table-land, which rises abruptly from both coasts, and occasions a great diversity of climate, within a narrow space; so that, while the low country on the coasts is hot and unhealthy, the table-land generally enjoys a mild and equable temperature, rising, however, in some places to an arctic rigour. The most remarkable portion of this plateau is the Vale of Mexico, which is of an oval form, 55 miles long and 37 broad, surrounded by ridges of porphyritic and basaltic rocks, and containing a series of five lakes, which were formerly of considerable extent, but are now diminished by means of a great drain which carries their waters to the river Panuco. The water of

the lake of Tezcuco, the lowest of the five, is salt, but that of the other four is fresh. Mexico is very rich in the precious metals; and Humboldt states that at the period of his visit there were 3000 mines of gold and silver in the country, but the ignorance and misrule which prevail have much diminished their value as a source of wealth.

The temperature and climate are extremely various. The country is divided into three regions named respectively the tierras calientes, or hot regions; the tierras templadas, or temperate regions; and the tierras frias, or cold regions. The first include the low grounds on the east and west coasts, under the elevation of 2000 feet; the mean temperature is about 77° Fahrenheit; the country is especially suited for the growth and cultivation of sugar, indigo, cotton and bananas, which all flourish luxuriantly; but is almost inaccessible by sea for one half of the year, owing to the prevalence of boisterous gales and north winds; and during the other half is extremely unhealthy, from the oppressive heat and the great quantity of rain that falls. The coast then becomes the seat of pestilential fevers; and a European arriving for the first time at Vera-Cruz, or any other part of the coast within the tropic, in August, September, or October, has little chance of escaping the yellow fever. But, at the height of 3000 or 3500 feet above the level of the sea, that scourge is quite unknown. The temperate regions, which are of comparatively small extent, occupy the slopes of the mountains from about 2500 to 5000 feet of elevation. The mean heat of the year is from 68° to 70°, and the extremes of heat and cold are alike unknown. The Mexican oak and most of the fruits and cerealia of Europe flourish in this genial climate; fogs, however, are frequent, occasioning great humidity; but producing great beauty and strength of vegetation. The cold regions include the table-lands and the mountains elevated 5000 feet and upwards above the level of the sea. The mean temperature of the table-land generally may be about 62°; but in the city of Mexico it sometimes, though rarely, falls below the freezing point. In the cold season the mean heat of the day varies from 55° to 70°; while in summer it seldom rises in the shade above 75°. Above 8000 feet, the climate is severe and disagreeable; and, under the parallel of Mexico, the snow line varies from 12,000 to 15,000 feet above the level of the sea. The climate of the table-land is on the whole favourable to human life, and the prevalent diseases are believed to be more owing to the bad habits of the people than to the qualities of the soil and climate.

The classes of the population are singularly varied, and are characterized by distinctions more striking than those in any other country. Four distinct and rival classes may be enumerated: 1. The Chapetons or pure Spaniards, few in number, and now considered a degraded class; 2. The Creoles, or natives of European descent, forming the wealthiest and most powerful part of the population; 3. The Indians, or native Mexicans, forming the great mass of the labouring population; 4. The mixed classes, comprising mestizoes, mulattoes, zambos, &c. But, so far as political privileges are concerned, all distinction of colour has been abolished, and persons of all complexions are admitted to the enjoyment of equal civil rights. The actual amount of the population is unknown; but it has been variously estimated between 5,000,000 and 8,000,000.

The government is based on a constitution dated 4th October 1824, and modelled on that of the United States of North America. The country is divided into nineteen states, besides the federal district containing the capital, and three territories. Each of these divisions manages its own internal affairs; while the general interests of the confederation were entrusted to a Congress, consisting of a house of representatives, a senate, and a president. But the government is still extremely unsettled; insurrections are continually taking place; the laws are powerless, and general tranquillity is unknown. The Roman Catholic is the only publicly recognised religion, though others are tolerated; but religion has little influence over the white population, and the hold of the church over the Indians is fast diminishing; for they are all more or less inclined to return to their ancient idolatry. The necessity of education is recognised by the constitution, which requires the priests to teach all persons to read and write; but in practice it is little attended to; and the progress of science, literature, and the arts, has been completely checked by the unsettled state of the country since the revolution which separated Mexico from the dominion of Spain.

With respect to productive industry, every branch of it is in the lowest state. Agriculture is neglected, and even the lands which were cultivated by the Spaniards are now lying fallow. Artificial irrigation, which is necessary to fertilize the lands, is almost abandoned; and the agricultural implements are of the rudest kind. All this is owing in some measure to the very excellence of the soil and climate, which produce the necessaries of life with so little labour that the mass of the people, without motive for exertion, are habitually indolent and unenterprising. The mines of gold and silver have always been considered the main sources of wealth. Before the revolution about 21,000,000 dollars in silver, and about 2,000,000 in gold, were annually produced from somewhat more than 3000 mines; but, notwithstanding the introduction of European capital and skill into some of these mines, the general production has diminished considerably, owing principally to the total want of security for working the mines or conveying the produce; but also in some degree to the want of honest and efficient labourers. But the mineral wealth of the country is inexhaustible; and there is only required a vigorous and honest Government to make the production greater than ever. The foreign trade is quite insignificant, and manufactures are scarcely known. Soap is the chief manufacture, and the country possesses great advantages for its production. Tallow is plentiful and cheap; and the carbonate of soda abounds in the table-land of Anahuac and in many other places. There are large established manufactories of this article in Mexico, Puebla, and Guadalaxara, and elsewhere.

The states and territories which compose the confederation are: *Las Chiapas, Chihuahua, Coahuila, Durango, Guanaxuato, Mexico, Mechoacan, New-Leon, Oaxaca, Puebla, Queretaro, San Luis Potosi, Sonora* and *Sinaloa, Tabasco, Tamaulihas* or *New Santander, Vera-Cruz, Xalisco, Yucatan, Zacatecas;* the Federal district; and the territories of *New Mexico, Colima,* and *Tlascala.* (See note to page 531.)

Mexico or *Mejico* (anciently *Tenochtitlan*), the capital, is situate on a group of islands, formerly surrounded by the lake of Tezcuco, which, however, has been so much diminished by draining, that its margin is now 2¼ miles from the city, the intervening space remaining a swampy flat, and crossed by elevated causeways. Mexico stands about 7426 feet above the level of the sea, in N. lat. 19° 25′, and W. long. 101° 25′. It is said by Humboldt to be undoubtedly one of the finest cities ever built by Europeans in either hemisphere; being inferior only to St. Petersburg, Berlin, London, and Philadelphia, in respect of the regularity and breadth of its streets, and the extent of its public places, of which, the Plaza Mayor, or great square, is one of the finest to be seen in any city. It contains on one side the cathedral, a large and imposing pile, of mixed Gothic and Italian style, built on the site of the great temple of the god Mexitli, and containing several rich ornaments and curious remains of antiquity. The population amounts to 137,000, of whom one-half are creoles, and only about 6000 Europeans. The two sea-ports of Mexico are Vera-Cruz and Acapulco, the former on the east coast, the latter on the west. *Vera-Cruz* (founded by Cortes, who named it *Villa Rica de la Vera-Cruz*, rich city of the true cross), is situate on the shore of the Gulf of Mexico, in N. lat. 19° 11′. It is a well-built and handsome town, but extremely unhealthy. Opposite the town, at the distance of half-a-mile, on an island, is the strong castle of San Juan d'Ulloa, commanding the harbour, which is a mere anchorage, and exceedingly insecure. *Acapulco* is a small town, on a very fine bay of the Pacific S.S.W. of Mexico. It was formerly the seat of the trade between Mexico and the Philippine islands; but, in the present state of affairs, is comparatively unimportant. *Xalapa* or *Jalapa*, a large town of 12,000 inhabitants

stands on a little platform above Vera-Cruz, about 4335 feet above the level of the sea. It was formerly a place of great trade, but is now merely a resting-station between Mexico and the coast. *Puebla de los Angeles* (Angels' town), is a large manufacturing and well-built town, with 34,000 inhabitants, 70 miles S.E. of Mexico. The other principal towns are: *Queretaro, San Luis Potosi, Guadalaxara, Zacatecas, Durango, Monterey, Guanaxuato, Valladolid*, and *Tampico*, to the north and west of Mexico; *Atlixco, Guauchinango, Ametopeo, Tepeaca, Tehuacan, Hapa, Zacatlan, Oaxaca, Tehuantepec*, and *Ciudad Real*, to the south-east; *St. Blas*, a small sea-port town, on the Pacific, 400 miles W.N.W. of Mexico. At *Cholula*, to the north of Puebla, is a great pyramid, which rises by several stages 177 feet, from a base of 1423 on each side. A smaller but more elegant pyramid stands in the northern part of the state of Vera-Cruz. It is formed of large blocks of porphyry, highly polished, and rises by six stages 65 feet high, from a square base of 82 on the side. The mountains of Texcuco, east of the lake of Mexico, are nearly covered with the remains of ancient buildings and cities. Near *San Domingo de Palenque*, a village in Las Chiapas, are the imposing remains of an ancient city named *Culhuacan*, which, after being buried for ages in a thick forest, were first rediscovered in 1787. The ruins present the most curious and most remarkable monuments of the new world, consisting of temples, fortifications, tombs, pyramids, bridges, aqueducts, houses, vases, idols, medals, musical instruments, colossal statues, and well-executed figures in low relief, adorned with characters which appear to be real hieroglyphics. Every thing announces that the city was formerly the residence of a people far advanced in architectural skill, in sculpture and painting, a people whose tall and elegant figures, fine proportions and figures, bear no affinity to anything Asiatic, African, or Malay. The ruins extend for more than twenty miles along the summit of a ridge, which separates the country of the Mayas from the state of Chiapas, and must anciently have included a city and its suburbs.—*(See Jour. R. Geog. Soc. Lond.)*

VI. *CALIFORNIA.*

California was formerly subject to Spain, and afterwards to Mexico; but in 1836 the people revolted, declared the country independent, and established a congress of deputies for their future government. The exact boundaries, however, of the new state we are not acquainted with; and it is probable that they will still remain for sometime in dispute between the Californians and their neighbours of Mexico and Texas, and will probably form the fertile source of future wars, when these states become peopled towards their respective boundaries. The country at present included under the general name of California, extends from the borders of the Mexican province of Sonora, near the head of the Gulf of California, about 31° N. lat. to 42° N. lat., where it is conterminous with the Oregon territory claimed by the United States of North America. It also includes the long peninsular promontory, which forms the gulf, and terminates southward with Cape San Lucas, in 22° 48′ N. lat.; the eastern boundary being the Rocky Mountains, and the western, the Pacific Ocean. The country is naturally divided into two parts, the Old or Lower, and the New, or Upper. Old California comprehends the long peninsula, between the gulf and the Pacific Ocean, and extends about 700 miles in length, with a breadth varying from 30 to 100, comprising an area of about 38,000 square miles, with a scanty population of 14,000 or 15,000. A chain of rocky mountains, not exceeding 5000 feet in height, runs through it from south to north; and the surface of the country consists of groups of bare rocks, broken by ravines and hills, interspersed with barren sandy tracts, and forms altogether one of the most barren and unattractive regions within the temperate zone. It is said, however, to be rich in metals. The climate is excessively dry and hot, and violent hurricanes are frequent; timber is very scarce; and the greater part of the country is incapable of producing a single blade of corn. Some sheltered valleys only produce maize, and a variety of fruits, as dates, figs, &c. which are preserved and exported; wine is also made, and a kind of spirit is distilled from the must. Cattle are somewhat numerous; wolves, foxes, deer, goats, snakes, lizards, and scorpions are among the wild animals. The pearl fishery in the gulf has been famed from its first discovery; at present it produces annually pearls to the value of from 500 to 1000 dollars. Pearls, tortoise-shell, hides, dried beef, dried fruits, cheese, and soap constitute all the exports, which are mostly sent to Mazatlan and San Blas in small coasting vessels. The people are a feeble and indolent set of Indians, whom the Jesuits have partially converted to Christianity; but they are little advanced beyond the rudest stage of savage life, and depend for their subsistence on hunting and fishing, with the spontaneous produce of the soil.

Upper or New California extends from the Pacific Ocean to the Rocky mountains; but the only tract inhabited by European settlers is the narrow strip of land along the coast of the Pacific, which is bounded inward by the maritime range of hills, at the distance of about 40 miles from the sea. The surface of this region is very diversified, and consists of hills and plains of considerable extent; along the coast there are several good harbours, of which *San Francisco*, in lat. 38°, is one of the largest and best on the west coast of America. The rainy season is in winter, from November till February. During the rest of the year there is no rain, but a few showers fall in some places. In summer the heat is very great. The country offers nevertheless a striking contrast to the peninsula. There is a profusion of forest trees on the western side of the mountains along the coast; and many fine fruits are easily cultivated, though few are indigenous. Among these is a species of vine, which produces grapes of considerable size, and so plentiful, that considerable quantities of brandy are distilled from them. Among the wild animals are reckoned the American lion and tiger, buffaloes, stags, roes, elks, bears, wolves, jackals, wild cattle, foxes, polecats, otters, beavers, hares, rabbits, &c. Birds of various kinds are exceedingly abundant. But the great and most important article of produce is black cattle, the multiplication of which has been really prodigious. In 70 years the number had increased from 23 to 210,000 branded cattle, and probably 100,000 unbranded; and it is found necessary to slaughter 60,000 annually to keep down the stock. Sheep have increased with nearly the same rapidity, but are at present of little importance to the trade of the country. Between the maritime chain and the Rocky Mountains is a dry and sandy plain or desert, 700 miles in length, by 100 in breadth at its south end, and 200 at the north, which is traversed by the rivers Colorado and Gila, and forms the eastern limit of the inhabited, and indeed only habitable part of the country. The natives are a poor, filthy, pusillanimous set of Indians in the most primitive state of barbarism, except those who have been converted nominally to Christianity, and who have been taught a few of the simpler arts and practices of civilized life. These reside in missions, where the men are employed in agriculture, or in the warehouses or workshops of the mission, while the women are occupied in spinning, grinding corn, and other domestic duties. They are in fact slaves to the monks who possess the missions; and the greatest part of the land, and especially that to the south of Monterey, is in the hands of the missionaries. The total amount of free settlers, including those of mixed blood, does not exceed 5000. Besides the missions there is another class of settlements called *presidios*, which were formerly under the charge of military officers, belonging to the service of Spain or Mexico. The only place of importance, beside San Francisco, is *Monterey*, in lat. 35½ N.—*(Coulter, Notes on Upper California; Jour. R. Geog. Soc. V. 66.)*

VII. *YUCATAN.*

This State forms a large peninsula, situate between the Gulf of Mexico and the Bay of Honduras, between 17° and 22° N. lat., and 86° 30′ and 91° 20′ W. long.; is nearly 400 miles in length from north-east to south-west, by about 200 in breadth, and contains an area of about 76,000 square miles. The central part of the peninsula is occupied by a ridge of high ground, which becomes gradually lower as it advances to the north; at the southern extremity its elevation is about 2000 feet, but near Cape Catoche, it sinks to a few hundred. On the west side the ridge is skirted by an extensive plain, which, towards the north, is about 100 miles wide, and becomes narrower towards the south. Its surface is, however, so sandy and arid, that from the Bay of Campeché to Cape Catoche, there is not a single spring of fresh water along the coast. To the south of Cape Catoche on the eastern side of the peninsula, and also on the west coast, to the south of the Rio Francisco, near Campechá, as far as the mouth of the river Usamasinta, the country is undulating, and even hilly. The soil, except on the very shores, is less sandy, and the country is chiefly covered with lofty forest trees. The climate is hot but healthy. In some parts of the territory, maize, frijoles, rice, cotton, pepper, tobacco, and sugar, are raised; but the aridity of the soil is a great drawback to agriculture; the rainy season is very uncertain, so much so, that in some bad years the inhabitants are obliged to have recourse for subsistence to the roots which the woods supply. Bees' wax is collected in considerable quantity in the eastern districts. There are no mines; and the extensive trade which Yucatan once carried on with the Havanna, was stopped by the revolutionary war, and has not since been renewed. Yucatan formed, till recently, one of the members of the Mexican confederation; but the people have now separated from the union and declared themselves independent, on the same grounds as the Texians, and have established a constitution on the most liberal political, religious, and commercial principles. The population was estimated in 1837 at 570,000. They are chiefly whites, but there are also many Indians of the Maypa nation, who had attained a considerable degree of civilization before the arrival of the Spaniards, and some of them have maintained a sort of independence.

Merida, the capital, a very fine city, with a splendid cathedral, is situate on the arid plain, about 24 miles from the north coast. It carries on some trade in agricultural produce by means of the small harbour of *Sizal*, which is formed by a sandbank, and has little depth of water. Population, 35,000. *Campeché*, a fine handsome town, completely fortified, on the west coast, has a population of 16,000, and exports considerable quantities of wax, and of the dye-wood which goes by its name. Its harbour is not very safe; and large ships cannot lie near the town, on account of the shallowness of the water. Considerable quantities of the same wood are also exported from *Bacalar*, a town on the Rio Hondo, which flows into the Bay of Honduras, north of Belize. In the eastern part of the State, and particularly to the south of Merida, there are the remains of several ancient stone structures; one of which, called by the natives Oxmutal, is still in good preservation. It is about 600 feet square, the rooms, corridors, and pillars are ornamented with figures, in half relief, of serpents, lizards, &c., in stucco. There are also figures of men, in the attitude of dancers, and resembling in every respect those which are found in the ruins at Palenque.

VIII. *THE UNITED STATES OF CENTRAL AMERICA.*

These States include the narrow tract of country which extends from Mexico to the isthmus of Panama, between the Caribbean Sea and the Pacific Ocean, being about 1000 miles in length, and from 50 to 200 in breadth. They comprise an area of 196,000 square miles, with a population of about 2,000,000, divided into the five States of *Guatemala*, *Honduras*, *Nicaragua*, *Salvador*, *Costa Rica*, and the federal district of *San Salvador*, besides the almost independent territories of *Poyais*, and the Musquito Indians on the north-east coast. The country is chiefly occupied by a long range or ranges of mountains, which, as in Mexico, form a table-land in the central parts of the country, reaching the general elevation of about 6000 feet above the level of the sea. There are also two large plains, those of Nicaragua and Comayagua, besides many of smaller size on the banks of the rivers, and along the sea coasts, which contain many deep and capacious gulfs and excellent harbours. The low country on the coasts is exposed to violent heat, and is extremely unhealthy. At Izabal on the Golfo Dolce, the heat is often from 95° to 100, and at Ystapa, on the Pacific coast, it ranges between 86° and 90° in June. In the interior, however, an equable and agreeable temperature may be obtained at the different elevations; the city of New Guatemala, for instance, enjoys a temperature of perpetual spring, the thermometer ranging between 52° and 68°. The dry season lasts from October till the end of May, during which the north winds prevail. The rest of the year is called the wet season; but the rains, though heavy, fall only at night, and the days are generally fair and cloudless. Earthquakes are very frequent; and are supposed to be caused by the numerous volcanoes which are scattered along the southern shores, the loftiest and most remarkable of which is the *Volcano d' Aqua* (Water Volcano), near the city of Guatemala is Antigua, 13,630 feet above the level of the Pacific. This mountain has never emitted fire from its crater, but only torrents of water and stones. The country likewise abounds with warm and medicinal springs. The gold mines of Costa Rica, and the silver mines of Honduras, are rapidly increasing in their products. The soil is every where extremely rich. The great staple productions of the country, and its principal articles of exports, besides the precious metals, are indigo, cochineal, sarsaparilla, hides, mahogany, cedar, dyewoods, balsam of Peru, sugar, and rapadura, or panela. The last is a kind of brown sugar, chiefly used for the distilling of spirits. The country also produces tobacco as good as that of the Havanna, cocoa, cotton; wheat, abundantly in Quesaltenango and other places; vanilla, coffee, pimento, pitch and naphtha, caoutchouc, and various medicinal plants, balsams, gums, and drugs. The tea plant also abounds, and silk may be successfully cultivated. Two species of locusts are remarkable, the brown and the green. The seas abound in pearls, tortoises, whales, and fish of various kinds. The birds are celebrated for their great variety, and the extraordinary beauty of their plumage. All the kinds of fowls common in Europe are reared. Cattle, horses, asses, sheep, goats, and hogs are in abundance; and though the horses are not good, yet the mules are of a very superior breed. The population is divided into the four grand classes of Indians, whites, blacks, and ladinos or mulattoes; the relative numbers of whom are: Indians, 685,000; whites, 475,000; ladinos, 740,000. The number of blacks is very inconsiderable. The constitution grants equal rights and privileges to all.

The independence of Central America was established in 1823, when the people adopted a constitution providing that the government should be vested in a Federal Congress, a Senate, and a President, appointed, not directly by the people, but by means of electoral colleges. The monkish orders have been wholly abolished, but Catholicism remains the religion of the State. The Spanish laws have also been entirely abolished, and Mr. Livingston's Louisiana code established in their stead. The cities of the federation are twenty-nine in number. The first is *San Salvador*, the seat of the general government in the federal district, which forms a circle round the city, twenty miles in diameter, with a further extension of ten miles towards the south, so as to include the roadstead of *Libertad*, on the Pacific. The State of Guatemala is divided into seven departments, namely, Guatemala and Escuintla, Chiguimula and Zacapa, Vera-paz and Peten, Quesaltenango and Socunusco, Totonicapan, Sacatepequez and Chilnaltenango, Sololo and Suchitepequez. In 1834, "The Eastern

Coast of Central America Commercial and Agricultural Company," established in London, obtained from the Government of Guatemala a grant by charter of the whole of the department of Vera-paz, which is about 250 miles in length, and as much in breadth, lying between 15° and 19° N. lat., and 88° and 92° W. long., and comprising at least 14,000,000 of acres; and subsequently a further grant of the port and district of Santo Thomas, containing about 1,000,000 of acres, which extends to the Bay of Honduras, between the river Motagua, on the south, and the Golfo Dulce with its outlet on the north. The company have already established a number of British and German settlers in Vera-paz, where they have founded two cities, one named *Abbotsville*, on a branch of the river Polochic, about 100 miles from the sea, and another named *New-Liverpool*, on the river Cajabon, two miles above its confluence with the Polochic. They have also engaged to build a town at the splendid harbour of Santo Thomas, on the Bay of Honduras, between the river Motagua and the entrance to the Golfo Dulce, both of which are navigable for a great distance inland, and form the principal Atlantic outlets of the State of Guatemala. This harbour resembles in form the edge of a horse-shoe, with an entrance two miles across, and five fathoms deep; within, the breadth is about six miles, with a depth of six fathoms up to the very shore, and protected from every wind. The river Polochic, which forms the highway between the sea and the settlements in Vera-paz, runs from west to east-south-east for a direct distance of about 70 geographical miles, and falls into the *Golfo Dulce*, a fine lake, 24 geographical miles in length, by 10 in breadth, with an average depth of 6 or 8 fathoms on a bottom of bluish clay. The outlet of the lake forms a navigable river, which runs six miles, and then forms another lake, 9 miles by 2, named the "golfete" or little gulf, from which it runs 8 miles farther to the sea, between two ranges of hills, covered with impenetrable forests, and so overhung with verdure, as to be almost hidden at the entrance. The bar at its mouth has only 5 feet 9 inches water, and the Polochic is navigable only for vessels drawing less than 2½ feet.

The city of *Guatemala* is situate on an undulating plain 4961 feet above the level of the sea, at the distance of 26 leagues from the Pacific Ocean, in 14° 37′ N. lat. and 90° 30′ W. long. It is a well-built town with 40,000 inhabitants. *Old Guatemala (la Antigua Guatemala*, or *Santiago de los Caballeros de Guatemala)* is also a fine town amidst ruins, in a delightful valley, eight leagues west south-west of the new city, and containing 12,000 inhabitants. It has been several times destroyed by earthquakes and volcanic eruptions, and has been abandoned as the capital since the fatal earthquake of 1773. *Totonicapan*, the capital of the department of the same name, has a population of 12,000; *Quesaltenango*, 14,000; *Coban*, in Vera-paz, 14,000; *Salamá*, on the Polochic, 5000; *Izabal*, a village of about 40 huts, 3 houses, and a court-house, on the southern shore of the Golfo Dulce. The greatest part, however, of the export and import trade of Guatemala is carried on by the port of *Izabal*, and by that of *Omoa*, on the left of the entrance to the gulf.

The cities of Costa Rica, are, *San José*, *Cartago*, *Esparza*, *Alajuela*, *Heredia*, *Estrella*; of Nicaragua, *Leon*, *Granada*, *New Segovia*; of Honduras, *Comayagua*, *Tegusigalpa*, *Gracias*, *San Pedro Sula*, *Olanchito*, *Sonaguera*, *Trujillo* or *Truxillo*; of Salvador, *San Vicente*, *San Miguel*, *Santa Ana*, *Sonsonate*. The principal ports, besides *Izabal and Omoa*, are *Truxillo*, in the Bay of Honduras, *San Juan de Nicaragua*, *Moin*, and *Bocatoro* in the Caribbean Sea; *Calderas*, *El Realejo*, *La Union*, *Libertad*, *Acajutla*, and *Itapa*, in the Pacific

IX. *COLOMBIA, comprising the Republics of VENEZUELA, NEW GRANADA, and ECUADOR.*

After the revolt of the Spanish colonies, those in the north-western part of South America were formed into a large State, which assumed the name of Colombia or Columbia, in honour of the great discoverer; but, since 1831, Colombia has been divided into the three independent republics of Venezuela, New Granada, and Ecuador or Equator; the first occupying the north-eastern, the second, the north-western and central, and the third, the southern portions of the country. Colombia is situate between 12° 25′ N. and 5° S. lat., and between 60° and 83° W. long.; being about 1320 miles from east to west, and 1100 from north to south, and comprising an area of 1,160,000 square miles. The country is now divided among the new republics in the following proportions, namely, Venezuela, which comprehends 450,000 miles, with 900,000 inhabitants; New Granada, 390,000 miles, with 1,687,000 inhabitants; and Ecuador, 325,000 miles, with 600,000 inhabitants. The country is naturally divided into three zones or belts. The first comprehends the portion between the Pacific Ocean and the Caribbean Sea and the Andes; the second, the mountainous region; the third, the immense savannahs which stretch southward and eastward from the Andes to the river Amazon, with the mountain border of the basin of the Orinoco. The coast along the Caribbean Sea extends 2000 miles, and is indented with bays and inlets; that along the Pacific extends 1200 miles.

VENEZUELA comprises the eastern part of the country, stretching along the Atlantic Ocean and the Caribbean Sea, from the river Essequibo to the west side of the gulf of Maracaybo; and is divided into four departments, whose names and principal towns are stated in the following table:—

Departments.	*Cities and Towns.*
VENEZUELA, .	Caracas, La Guayra, Vittoria, Maracay, Calabozo, Los Reyes; Valencia, Puerto-Cabello, Tocuyo, Carora, San-Carlos, San Felipe, Aroa.
MATURIN, . .	Cumana, Barcelona, Assumpcion, Cariaco, Guiria, Carupano, Cumanacoa, Maturin, Aragua, Maniquarez, El Pao, San Diego, Piritu, Painpatar.
ORINOCO, . .	Varinas, Achagua, Angostura; Guanare, Obispos, Araure, Ospino, Nutrias, San Fernando, Mantecal, Payara, Esmeralda.
ZULIA, . . .	Maracaybo, Coro, Truxillo, Merida, Gibraltar.

Caracas, the capital, is situated in a delightful valley, at the foot of the peak of Silla, 330 feet above the level of the sea; but having been entirely destroyed by an earthquake in 1812, it has scarcely yet risen from its ruins. It is, however, the centre of a great trade with the interior, and contains upwards of 20,000 inhabitants. *La-Guayra*, a small sea-port town, with 4000 inhabitants, has a bad harbour, and an unhealthy climate, but is of great importance as the port of Caracas. *Valencia*, a considerable town, with 15,000 inhabitants, in a fine situation, with a healthy climate. *Puerto-Cabello*, an important sea-port town with a good harbour and a great trade, but in an unhealthy situation, and having only a population of 3000; 68° W. long. *Cumana*, a decayed city, with 10,000 inhabitants, is rendered important by its fortifications, trade, and fine bay, which is capable of receiving all the navies of Europe, with excellent anchorage for large ships, but the climate is intensely hot; W. long. 64° 16′. *Varinas*, south of the Lake of Maracaybo, was once a flourishing city, but has now declined to a population of about 3000. *Angostura* or *New-Guyana*, a small episcopal city on the Orinoco, with 3000 inhabitants, is important from its situation as a shipping port on the river. *Maracaybo*, a fine town on the west side of the strait which connects the lake with the bay of the same name, possesses a college, a pilot-school, several building slips, and is defended by three forts. Population 20,000. *Merida*, a small city with 5000 inhabitants, contains a university of the second rank, and a college. The Island of *Margarita* is situated off the coast of Cumana, from which it is separated by a channel

20 miles wide, through which all vessels coming from Europe, or windward of Cumana, Barcelona, and La Guayra must pass in going to those ports. The island is 37 miles long and from 5 to 20 wide, with a population of 15,000. It derives its name from the pearl fishery, for which it was once much celebrated, but which has greatly declined. The island is of little value. The chief towns are *Assumpcion*, the capital, in the centre, and *Pampatar*, on the south-east coast, with a good harbour, and anchorage in seven or eight fathoms water.

NEW-GRANADA comprises the isthmus of Panama, and the adjacent north-western part of South America. It is divided into four departments, whose names and chief towns are stated in the following table:—

Departments.	*Cities and Towns.*
CUNDINAMARCA, .	Bogotá (or Santa Fe de Bogotá), Medellin, Neyba, Honda, Antioquia.
CAUCA, ...	Popayan, Pasto, Iscuande, Quibdo.
ISTHMO, ...	Panama, Porto-Velo (Portobello), Chagres, Santiago de Veragua.
MAGDALENA, . .	Carthagena, Mompox, Santa-Marta, Rio-Hacha.
BOYACA, ...	Tunja, Pamplona, Cucuta, Socorro, Pore.

Bogotá, the capital, is situate at the foot of two mountains which shelter it from the violent east winds, on an elevated table-land, 8630 feet above the level of the sea, in N. lat. 4° 37′ and W. long. 74° 10′. The temperature of the atmosphere is fine and equable, but the climate is exceedingly humid, though not unhealthy. Externally, the city has an imposing appearance, but the streets are generally narrow though regular, with low houses. Nearly half its area is occupied by religious buildings, there being 26 churches besides the cathedral, 9 monasteries, and 3 nunneries. Population about 20,000. (See *ante*, p. 873). *Popayan*, a fine city, in a beautiful situation, near the sources of the river Cauca, contains a mint, a university, and about 7000 inhabitants. *Panama* is a well-built city, on a peninsula of the southern coast of the isthmus to which it gives its name. It has no harbour, but only a bad roadstead, and the population does not exceed 10,000. *Porto-Velo* or *Portobello* is a very small town or village on a fine natural harbour, but in so unhealthy a situation that it has acquired the title of the grave of Europeans. It stands on the north side of the isthmus, nearly opposite Panama. *Chagres*, a small town west of Portobello, derives its importance from its situation at the mouth of a river which affords an accessible passage from the north coast to within a short distance of Panama. *Carthagena*, an episcopal city on a sandy island off the north coast to the westward of the Rio Magdalena, possesses one of the finest harbours in America. It is strongly fortified, and contains about 18,000 inhabitants; and though much decayed, is still the centre of a considerable trade. *Santa-Marta*, a fortified town, on the coast to the eastward of the Magdalena, with considerable trade and 6000 inhabitants. *Rio-Hacha*, farther east, is a small town with only 1000 inhabitants, but is noted for the pearl fishery in its vicinity.

ECUADOR is so named from its lying under the equator, and extends only a few degrees of latitude to the north and south of it. It is divided into three departments, as stated in the following table:—

Departments.	*Cities and Towns.*
ECUADOR, ...	Quito, Antisana, Tacunga, Esmeraldas, Riobamba, Ibarra.
GUAYAQUIL, . . .	Guayaquil, Puerto-Viejo.
ASSUAY, ...	Cuença, Loxa, Cañar, Giron.

Quito is a large but ill-built city, in a valley enclosed by two ranges of the Andes, 9630 feet above the level of the sea, with a population of about 70,000. *Riobamba* is also a large town, with 20,000 inhabitants. *Guayaquil* is a commercial and seaport town, on a bay of the Pacific, with 22,000 inhabitants. *Cuenca* is a well-built city, with 20,000 inhabitants. About 30 miles from Cuenca is the famous *Paramo d' Assuay*, where many travellers perish from its terrible storms.

X. *THE REPUBLIC OF PERU.*

This Republic is situate on the western side of South America, having Ecuador and Brazil on the north; Bolivia and the Pacific Ocean on the south; Brazil and Bolivia on the east; and the Pacific Ocean on the west; between 3° and 22° S. lat., and between 63° and 81° 20′ W. long., being about 1500 miles in length, by 900 in breadth, and comprising an area of considerably more than 500,000 English square miles. The western portion of the territory is occupied by the highest ranges of the Andes, with their offsets and intervening valleys, while the eastern part slopes down into the great plains which occupy the centre of the continent, and are drained by the affluents of the La Plata and the Amazon. The independence of Peru was declared on the 15th, and more formally announced on the 28th of July 1821. In May 1822, a congress, which assembled at Lima, formed the plan of a constitution on the model of that of the United States of North America. But the government is still extremely unsettled, and in 1837 the country was placed under the protection of the president of Bolivia. It is divided into seven departments:—

Departments.	*Cities, Towns, &c.*	*Departments.*	*Cities, Towns, &c.*
LIMA, . .	Lima, Callao, &c.	AYACUCHO, .	Huamanga, Huancabelica, Jauja.
AREQUIPA .	Arequipa, Arica.	JUNIN, . .	Huanuco, Pasco, Junin, Baños.
PUNO, . .	Puno, Chucuito, Lampa.	LIBERTAD, .	Truxillo, Sechura, Payta.
CUZCO, . .	Cuzco, Abancay, Tinta, Urubamba.		

In 1836, however, the representatives of the four southern provinces assembled at Sicuani, declared their separation from the republic of Peru, and their incorporation as an independent state, under the title of *Estado Sud Peruano*, The South Peruvian State. This new State embraces the four provinces of Cuzco, Ayacucho, Puno, and Arequipa; the largest portion of its territory is situate among the Andes, or in the valleys which descend from the Cordillera. They are inhabited by a very numerous, agricultural, and industrious Indian population, and have hitherto formed the fairest portion of the Peruvian State. The assembly of Sicuani placed their country under the protection of General Santa Cruz, the enlightened president of Bolivia, whose administration of that republic, since 1829, had rendered it the model of good government, internal tranquillity, and financial prosperity.

Lima, the capital, is situate on the river Rimac, in a delightful valley, between 500 and 600 feet above the level of the sea, at the distance of six miles from the Pacific, in S. lat. 12°2′, and W. long. 77°17′. It is surrounded by a parapet wall about 7 miles in circuit; and, when seen from a distance, has an imposing appearance. The interior is divided into squares of houses, with streets crossing each other at right angles; but, on account of the frequency of earthquakes, few houses are more than one storey high, and the roofs are uniformly flat; and, till of late years, few of the windows had either glass or sashes. Besides a great many convents and nunneries, with churches attached, the city contains 57 churches and 25 chapels. The cathedral, founded by Pizzaro, and containing his remains, is a large fine building, with a magnificent interior. Several of the conventual churches are also remarkably rich. Lima is still the emporium of the trade of Peru, in which most of its inhabitants are engaged; the manufactures are insignificant. According to a census in 1818, the population amounted to 54,094.

Callao, the port of Lima, is connected with the city by a straight road, six miles in length. It is well fortified, but the houses are poor and mean, consisting of mud walls and flat roofs. The roadstead is the best in Peru; and there is a rudely constructed pier, at which vessels may load and unload. *Arequipa*, in the valley of Quilca, 7700 feet above the level of the sea, from which it is 30 miles distant, in S. lat. 16° 30′, is a large town, with about 30,000 inhabitants. *Arica*, a seaport town on the Pacific, in S. lat. 18° 28′, a poor town, is the natural outlet of one of the principal mining districts of South America, and of a large extent of country; but, owing to the heavy surf which beats upon the shore, it is always difficult, and sometimes impossible, to effect a landing, except in the balsas of the natives, which are a sort of floats made of inflated seal-skins. The town has only between 200 and 300 inhabitants. *Puno*, the capital of a department, is said to have 18,000 inhabitants. *Cuzco*, the ancient capital of Peru, is nearly as large as Lima, but not quite so populous, the number of its inhabitants amounting, in 1826, to 46,123. It is situated in a valley or plateau 11,380 feet above the level of the sea, about 400 miles E.S.E. of Lima, in S. lat. 13° 30′. The cathedral, and the convent of St. Augustine, are said to rank among the finest religious buildings of the New World. It still contains several remains of the architecture of the Incas, and many of the private houses belong to that era. The people are said to be industrious, and to excel in embroidery, painting, and sculpture. Cuzco contains manufactories of cotton, linen, and woollen stuffs, leather, and parchment; and has a considerable trade in these and the products of the adjacent district. *Huamanga*, the chief town of the department of Ayacucho, is a large and flourishing commercial town, with 39,000 inhabitants. *Truxillo* is a fine city, with 14,000 inhabitants, on the coast, 300 miles N.N.W. of Lima. The *desert of Atacama* divides Peru from Chili, and is nearly 10 miles in length, through which a river abounding in salt flows. It seems to have been the favourite burying-place of the Peruvians for successive ages. The climate, salt, and sand dry up the bodies, and the remains of whole generations may now be seen there, after the lapse of perhaps thousands of years.

XI. *BOLIVIA or UPPER PERU*

Is situate between 9° 30′ and 25° 40′ S. lat., and 58° and 71° W. long., having Lower Peru, on the north and north-west; Brazil and Paraguay, on the east; Chili and La Plata, on the south; and the Pacific Ocean, on the west. It is about 1100 miles in length N.-S., and about 750 in breadth, and comprises an area of about 320,000 English square miles. In the west it is traversed by lofty mountains, while in the east it stretches into immense plains. Upper Peru remained in possession of the Spanish Government till 1824, when it was rescued from their grasp by the battle of Ayacucho, and its independence declared in August 1825. The government is still unsettled, and has already experienced many changes. The statistics and present state of the country are very imperfectly known, and the population of both the country and the cities is very variously estimated. Balbi states the general population at 1,300,000; Brackenridge, at 1,716,000; while some estimate it so low as 650,000. More than three-fourths of the people are believed to be aborigines; but though in a low state of civilization, they have been converted to Catholicism. The country is very unfavourably situated for communicating with foreign nations.

Chuquisaca, formerly *Charcas*, the capital, is a considerable town, with 12,000 inhabitants, situate in a plain 9250 feet above the level of the sea, on the east side of the Andes. *La Paz d' Ayacucho* is a large episcopal city, with 40,000 inhabitants, in a deep valley, 10,883 feet about the level of the sea; a few miles to the south-east is the Nevado d'Illimani, the highest peak of the Andes, after that of Sorata. *Tiahuanacu*, near the lake of Titicaca, is celebrated for its ruins, which are believed to be the remains of a people who possessed the country before the rise of the empire of the Incas. The islet *Titicaca*, which gives its name to the lake, is celebrated in Peruvian history as the place where Manco Capac received the divine call to be the lawgiver of Peru. The Peruvians consequently regarded it as a sacred place, and the Incas built upon it a temple of the sun, which they covered with plates of gold; and to it people brought from all parts of the empire rich offerings of gold, silver, and precious stones; all of which are said to have been cast into the lake at the arrival of the Spaniards. *Potosi*, a large but decayed city, at the foot of the Cerro de Potosi, which has been celebrated for the prodigious quantity of silver obtained from it since the mine was first discovered in 1545. The mountain is pierced with mines in every direction. The great square of the city is 13,314 feet above the level of the sea. At the time of its greatest prosperity the city contained 160,000 inhabitants; but in 1826 the number was reduced to 9000. *Cochabamba* is a large city, with 30,000 inhabitants, in a fertile and well-cultivated country. *Santa-Cruz-de-la-Sierra* is a small and ill-built episcopal city, in the midst of an immense plain, with 9000 inhabitants.

XII. *CHILI or CHILE (TSHEELEE)*

Is situate between 25° and 44° S. lat., along the coast of the Pacific, and comprises the country between the crests of the Andes and the sea, being about 1150 miles in length, by 120 in breadth, and containing an area of 130,000 square English miles. The shores are mostly high, steep, and rocky; but have almost every where deep water: there are several tolerable harbours, the best of which are those of Valdivia, Conception, Valparaiso, and Coquimbo. The climate is equable and healthy. Both the climate and the soil of the southern and the central parts are suited to the culture of European grains; but only the middle provinces produce a sufficient quantity of corn to admit of exportation. Wheat is the staple, and, in the north, almost the only grain cultivated. Barley is grown in the south; but agriculture generally is in a very backward state,; the breeding of cattle is the most important branch of rural industry. Some farms feed from 10,000 to 15,000 head: some even so many as 20,000; and the smallest contain from 4000 to 5000. The horses, mules, and asses, are well made, and useful animals; the sheep are said to be very inferior. The people are chiefly of Spanish and Indian descent; but there are some negroes and mulattoes. Their religion is the Roman Catholic; but the clergy are not numerous; other religions are tolerated, though the exercise of their public worship is not allowed. The executive government is vested in a president and council; the legislative, in a congress of 56 members, who are elected by the provinces. The Chilenos are good potters, and make light and strong earthenware jars which ring like metal. Canvas, cordage, soap, copper-wares, leather, brandy, tallow, and charcoal, are the chief articles manufactured. The commerce has of late years been rapidly increasing. Most of the foreign trade is maintained with Great Britain; the exports are chiefly bullion, copper, hides, tallow, pulse, wheat, fruit, and drugs. *Valparaiso* is the principal port, and the centre of the foreign trade. There is little means of internal communication. The only towns of any importance, except the capital, are situate on or near the coast, at a great distance from each other, and there are few or no roads which are passable by carts.

Santiago, the capital, is situate on the banks of the river Mapocho or Topocalma, in a vast plain, and has a delightful climate. It is well built, with several fine public buildings, and contains about 55,000 inhabitants. *Valparaiso*, a fine newly-built town, with 20,000 inhabitants, is the principal seaport and the centre of the foreign trade of Chili. It has a fine harbour, with an easy entrance, sheltered from all winds except the north wind, which blows violently in winter. *Coquimbo*, a considerable seaport, with 12,000 inhabitants. *Concepcion*, a regularly built town, with 10,000 inhabitants, near the

mouth of the river Biobio, was completely ruined by an earthquake in 1835. *Valdivia*, a small fortified town, in the Araucanian territory, with a superb natural harbour, which is considered as one of the finest in America. Population about 5000.

XIII. *THE UNITED PROVINCES OF LA PLATA, or THE ARGENTINE REPUBLIC.*

These provinces, with the exception of Paraguay and Banda Oriental, comprise the whole of that vast country which lies between Brazil and the Cordillera of Chili and Peru, and extends from the 22° to the 41° S. lat. They comprehend altogether an area of 726,000 square miles, with a population of 600,000 or 700,000 inhabitants. This vast territory is now divided into thirteen provinces, which govern themselves independently to a certain degree; though, for all general and national purposes, they are confederated by conventional agreements. From the want of a more defined national executive, the provincial government of Buenos-Ayres is temporarily charged with carrying on the business of the Union with foreign powers, and with the management of all matters that concern the republic in common. The executive power of that government is vested in the governor or captain-general, aided by a council of ministers chosen by himself, and responsible to the junta or legislative assembly of the province by whom he is elected.

Estimated Population of the Provinces in 1836–7.

Province of Buenos Ayres,	from 180,000 to 200,000		Province of Catamarca,	. from	20,000 to 35,000

Besides the independent Indians within the territory claimed by the republic.

Excepting only along the western and the eastern borders, where the offsets of the Chilian, Peruvian, and Brazilian Andes are found, the whole of this region is a vast plain, traversed in its northern and central portions by the numerous affluents of the Plata, and stretching out to the south-west into the boundless *pampas*. These plains, reaching from the eastern terminations of the Andes to the shores of the Plata, appear to be one immense bed of alluvium, tranquilly deposited during the lapse of ages, and now presenting a uniformly level surface, which is covered with long grass. Towards the north-west, between the provinces of Cordova, Santiago, Catamarca, and La Rioja, between 29° and 30° S. lat., is a vast sandy plain, from 30 to 40 leagues in breadth, which is for the most part covered with a saline efflorescence, and produces a salsola, from the ashes of which soda is extracted. It is called the *Travesia* or *Las Salinas*. The country is capable of producing, in its northern and central portions, all the usual productions of tropical countries, and in the south it yields good wheat; but hitherto the staple articles of produce have been animal and mineral only. Gold, silver, and copper are exported in small quantities; but ox-hides, horse-hides, and horns, in enormous quantities, with beef, horse-hair, sheep's-wool, chinchilla skins, tallow, sheep-skins, &c., in smaller quantity. The value of the ox-hides exported in 1837 was 3,294,540 dollars; of horse-hides, 38,046 dollars; of horns 416,192 dollars; and of the total exports, 5,637,138 dollars, or £1,127,427 sterling. The hides and horns, which form two-thirds of the value of the exports, are the produce of the vast herds of horses and bovines reared mostly in the pampas, which are no longer a useless and unappropriated waste, in which the animals run wild as formerly, but have been carefully measured out and allotted to individuals who are obliged to set up and preserve their marks of possession. It is calculated by the best authorities that the most extensive proprietors in the province, that the present stock of cattle, in the territory of Buenos Ayres alone, may be from three to four millions; and it is supposed there may be a similar number in the other provinces. From this we ought to calculate upon an annual exportation of nearly a million of hides, with a gradual increase.— *Buenos Ayres and the Provinces of the Rio de la Plata, their present State, Trade, &c., by Sir Woodbine Parish, K.C.H., &c.* Lond. 1839.

Buenos Ayres, the capital, is situated on the south-western shore of the Plata, in S. lat. 34° 36′. It is built on a regular plan, with streets crossing each other at right angles, which are now tolerably well paved, and provided with footpaths; but contains no public buildings of any importance, except, perhaps, the cathedral, a large and handsome building, the interior of which is profusely decorated with carving and gilding. The population amounts to about 100,000; of whom from 15,000 to 20,000 are foreign, chiefly English and French. Though close to the river the city has no harbour, and vessels drawing 16 or 17 feet water anchor in the outer roads, 7 or 8 miles from the shore, loading and discharging by means of lighters. Between the outer and the inner roads there is a dangerous bar, and as the water becomes so shallow on the beach, that even boats cannot come close to the shore, but are met in the water by ox-carts, in which the goods are deposited, at no little risk, and sometimes with much loss. The climate of Buenos Ayres is influenced not so much by its latitude as by the wind, a change of which produces an alteration of 20° or 30° in the thermometer. The heat in summer is at times almost intolerable; the thermometer being perhaps at 90° within doors, and all nature gasping for air; but on those very days the most experienced of the natives are clothed in warm woollens instead of linen jackets, for fear of catching cold. During the greater part of the year the prevailing winds are northerly; and these passing over the marshy tracts of the interior, and the broad expanse of the Plata, bring with them a great degree of humidity, which produces a certain lassitude and relaxation, and induces great liability to colds, sore throats, and other evil consequences of checked perspiration. Buenos Ayres is, however, free from agues and fevers, which are rarely known. But from the bad effects of the north wind the atmosphere is occasionally most effectually cleared by the *pamperos* or south-west winds, which, originating among the snows of the Andes, and rushing with unchecked violence across the pampas, become often hurricanes before they reach the city, and not unfrequently bring with them clouds of dust, which occasion almost total darkness. Sometimes also the pampero is accompanied by the most terrific thunder and lightning than which nothing can be more appalling. The city of *Corrientes*, founded in 1588, is situate in S. lat. 27° 27′, at the junction of the rivers Parana and Paraguay, which afford every facility for an active commercial intercourse with the most remote parts of the republic, as well as with the sea, but without steam navigation, which has not yet been introduced, these cannot be made available. *Cordova* is situate in S. lat. 31° 26′, 172 leagues distant by the post-road from Buenos Ayres, in a pleasant valley, on the banks of the river Primero. It contains many churches, and is the seat of a university, once held in great repute, but now dwindled down to the dimensions of a provincial school. At present Cordova forms a sort of centre of communication between the upper provinces and Buenos Ayres. *Santiago-del-Estero*, a miserable, ill-built place, with 4000 inhabitants, in S. lat. 27° 47′; and, 40 leagues beyond Santiago, is the city of *San-Miguel-de-Tucuman*, in an elevated plain, where the climate, though hot, is dry and salubrious; and where nature has been so prodigal

of her choicest gifts, that the province of Tucuman well merits its appellation of the garden of the United Provinces. The city contains from 7000 to 8000 inhabitants. *Catamarca*, 60 leagues S.W. of Tucuman, contains about 4000 inhabitants; the city of *Salta*, in lat. 24° 30', and 414 leagues from Buenos Ayres, contains between 8000 and 9000; *Mendoza*, 32° 52' S. lat. and 69° 15' W. long., and 4891 feet above the level of the sea, contains about 10,000 inhabitants. About 106 miles W. by N. of the city is the volcano of Aconcagua, one of the highest of the Andes. The most southern settlement of the Buenos Ayreans is the little town *Del Carmen*, on the Rio Negro.

XIV. *PARAGUAY*

Is situated between 20° and 28° S. lat., extending along the eastern bank of the river Paraguay, from the Rio Parana to the Rio Blanco, about 450 miles, with a breadth of 180 miles; and is bounded on the south and east by the Parana. It comprises an area of about 80,000 square English miles, with a population of about 250,000. Besides the natural productions common to the region and climate, Paraguay produces a species of tea, called yerba-maté, which is as much in general use and demand through all the provinces of La Plata, Chili, and many parts of Peru, as the teas of China are in Europe. The plant which produces it (Ilex Paraguayensis) of which there are three species, is an evergreen, about the size of an orange tree, which grows wild and in great abundance in the dense forests of the northern and eastern parts of the province, to which the people repair yearly in numerous gangs to collect it. When the colonies revolted in 1810, the people of Paraguay refused to acknowledge the central government established at Buenos Ayres, declared their absolute independence, and established a government, the whole power and direction of which fell ultimately into the hands of Dr. Don José Gaspar de Francia, who has ruled the province for many years as absolute dictator, exhibiting a systematic selfishness, cruelty, and despotism, almost unparalleled in the history of any country. His revenue arises chiefly from properties confiscated, and from tithes in kind on all articles of produce. The principal expenditure consists in the maintenance of a large militia force, in which every person capable of bearing arms is enrolled and obliged to do duty in his turn. Francia is of course commander-in-chief of the army, and is head of the church, the law, and every other branch of administration. The only trade has been carried on on his own account, and merely such as has been necessary to further his policy of habituating the people to look to him and to him only for the supply of all their wants.—(*Parish*, 226, &c.)

Asuncion (Assumption) the capital, is finely situate on an eminence on the left bank of the Paraguay, in S. lat. 25° 16'. It is an ill-built town, with unpaved streets, and houses little better than huts, but contains about 10,000 inhabitants. It is the centre of a considerable trade in hides, tobacco, timber, yerba-maté, wax, &c.; and the adjacent country is comparatively well cultivated and populous.—(*Robertson's Paraguay*, I. 288.)

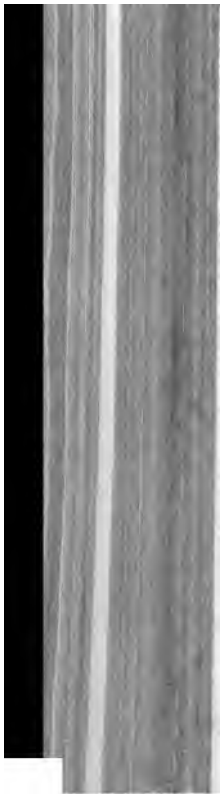
XV. *URUGUAY, or the BANDA ORIENTAL.*

This is a very compact territory, extending along the northern shore of the Plata, and is bounded on the west by the river Uruguay, on the south-east by the Atlantic Ocean, and on the north-east and north by the Brazilian territory; comprising an area of about 75,000 square English miles, with a population of about 120,000, which is rapidly increasing. It was formerly a portion of the vice-royalty of Buenos Ayres; being afterwards subdued by the Portuguese, it became a province of Brazil; but, at last, by an article in the treaty of peace between Brazil and Buenos Ayres, it was declared independent.

Monte Video, the capital, is a fortified town with a citadel, situate on a peninsula on the northern shore of the Plata, 125 miles E. by S. of Buenos Ayres, and contains 10,000 inhabitants. The houses are built of stone or brick, but are seldom more than one storey high, and flat-roofed; and the streets are unpaved, so that they are either clouded with dust or loaded with mud, as the weather happens to be wet or dry. The town is ill supplied with water, and contains no public buildings of any importance; but the harbour is the best on the Plata. It is a large circular basin open to the south-west, and having on its western side the hill (*Monte Video*), from which the city derives its name. On the top of the hill is a lighthouse, the lantern of which is 475 feet above the level of the sea. *Maldonado*, 85 miles E. of the capital, is a fortified seaport town on the Plata. It is a small quiet town, with scarcely any trade. *Colonia del Sacramento* is a seaport town at the Plata, nearly opposite Buenos Ayres.

XVI. *THE EMPIRE OF BRAZIL.*

This extensive territory stretches along the Atlantic Ocean from 4° 17' N. to 33° S. lat., about 4000 miles, occupying the eastern part and a large portion of the centre of the continent to the extent of about 2,500,000 square miles. Nearly two-thirds of the country consist of high lands and mountains; and the cultivated lands bear a very small proportion to those still lying in a state of nature. The total population has been estimated at 5,300,000. The most celebrated of the natural productions of Brazil are diamonds, which are found in the provinces of Minas-Geraes, Minas-Novas, Goyas, and Matto-Grosso. The most celebrated mines are those of Serra-do-Frio, which are also known by the name of the Arrayal Diamantino, or Diamond district. This district is surrounded by almost inaccessible rocks, and used to be guarded with so much vigilance that not even the governor of the province had the liberty of entering it, without the special permission of the director of the mines. Gold and silver are also supposed to exist in great abundance; and, after Mexico and Peru, Brazil has furnished Europe with the greatest quantity of these precious metals. Iron abounds in the mountain chain of Morro near Villarica, and in other places; while in the province of Minas-Geraes, there is a mine of magnetic iron-stone, containing from 80 to 90 per cent. of pure iron. Platina and copper have also been found in Minas-Geraes. Precious stones abound in Brazil, especially topazes, of which there are a great many varieties. Among the vegetable productions are sugar, coffee, cotton, cocoa, rice, tobacco, maize, wheat, mandioc, beans, cassava root, bananas, ipecacuanha, ginger, yams, oranges, figs. Of these the most important are sugar and coffee, which have indeed become the staple productions of the empire. Sugar is mostly produced in the vicinity of Bahia, and coffee, near Rio, but the cultivation is rapidly extending in other provinces. Cotton is grown in the province of Pernambuco, and, in respect of quality, is inferior only to the sea island cotton of North America. The forests furnish almost every variety of useful and ornamental timber, with logwood, and other dye woods, of which the most valuable is the Brazil-wood, which produces a beautiful red colour. The cocoa tree is plentiful on the sandy soil along the coast; and the carrassato or castor-tree, is much cultivated for the sake of the oil which is extracted from its seed. The useful animals, as horses, beeves, and sheep, all introduced from Europe, have increased astonishingly; and hides, tallow, jerked beef, horns, and bones have long formed leading articles of export. Sheep, however, have not increased so rapidly as horses and beeves. Manufactures can hardly be said to exist, and are restricted to the production of the coarsest kinds of cotton cloth, the tanning of leather, and some others of the simplest useful arts. The trade, however, is very extensive, and the commercial system is one of great freedom and liberality. Notwithstanding a convention between Great Britain and Brazil,



no elements at work to effect such a penetration by the State of its soc
trative purposes, the empire is divided into the eighteen provinces of

Matto-Grosso, has 25,000 inhabitants.

XVII. *GUIANA, GUYANA, or GUAY*

Is the name of that wide region which lies between the Orinoco and
however, than one-half of Guiana is now included within the northern limi
within the limits of Venezuela; and the remainder is divided into thr
Dutch, and *French Guiana*.

British Guiana is the most westerly of the three, and comprises the co
Essequibo, Demerara, and Berbice, to the actual extent of about 12,000 s
claimed is no less than 64,000 square miles of additional territory within th
Spanish Guiana. The smaller and undisputed portion extends along the coa
Essequibo to the Corentyn, about 100 miles. An alluvial flat borders the c
10 to 40 miles, terminating at the foot of a range of sandhills, from 30 to 1
are several ranges and groups of hills, one of which, about 5° N lat., co
crosses the beds of the rivers from west to east, forming large cataracts;

larly during the day. Hurricanes are unknown, and gales unfrequent. Thunder storms occur at the changes of the seasons. The low and swampy coasts are unhealthy, but the interior is more salubrious. The forests abound with trees of immense size, yielding the most valuable timber, with many medicinal plants, dye woods, and woods for cabinetmaking. *Arnotto* grows wild on the banks of the upper Corentyn; and there is another indigenous plant, called the *hai-arry*, a papilionaceous vine, the root of which is powerfully narcotic, and is commonly used by the Indians to poison the water for the purpose of taking fish. The staple vegetable productions are sugar, coffee, and cotton; of which the first is the principal, the two latter being now less extensively cultivated than formerly; and, since 1837, there has been a rapid decrease in the growth and exportation of them all, which may be ascribed, partly at least, if not entirely, to the cessation of slave labour. The total value of the exports amounted in 1836 to £2,135,379; but in 1839, only to £986,013. The government is vested in a governor and a court of policy, which consists, besides the governor himself, of the chief-justice, attorney-general, collector of the customs, the government secretary, and an equal number of unofficial persons elected from the colonists. The revenue is derived from taxes on produce, incomes of 500 dollars and upwards, imports of foreign manufacture, and horses, carriages, wine and spirit licences, &c. In 1836 it amounted to £106,081, and the expenditure, to £113,946. The population is partly Dutch and partly British, most of whom are Protestants of various sects; and in 1838, 11,363 persons were receiving instruction in the public schools. The colony is divided into the three counties of *Essequibo*, *Demerara*, and *Berbice*, and contained, in 1834, 96,581 inhabitants, of whom only 3576 were white. The territory was a Dutch colony acquired by conquest in 1803.

Georgetown, the capital, is situated on the eastern bank of the Demarara river, and contains about 20,000 inhabitants. The streets are wide, and traversed by canals; the houses are of wood, and few are more than two storeys high. Within a mile of the town, near the mouth of the river, is Fort William Frederick, a small mud fort. *New Amsterdam*, on the Berbice, is a small town with 5000 inhabitants, and is reckoned less unhealthy than Georgetown.

DUTCH GUIANA extends along the coast from the river Corentyn, which separates it from Berbice, to the Maroni, which divides it from Cayenne; its length being about 250 miles, and its area, about 38,500 square miles. The aspect of the country, the climate, and natural productions, are much the same as those of the British territory. The principal river is the *Surinam*, which has a course of 300 miles, and gives its name to the northern part of the colony. The Government is vested in a governor-general and a high council. The population, exclusive of Indians and Maroons, is about 65,000, of whom 6000 are white and free coloured people, mostly Dutch, French, and Jews; the remainder consists of negro slaves. The capital is *Paramaribo*, a town with 20,000 inhabitants, neatly laid out in the Dutch style; and situated on the right bank of the Surinam, 18 miles from its mouth, where the river affords excellent anchorage. The fort of *Zeelandia*, a little north of the town, is the residence of the governor, and the seat of most of the government establishments. The inhabitants maintain an active commerce with Holland.

FRENCH GUIANA is the most easterly of the three colonies, and extends along the coast from the river Maroni to the river Oyapok, which forms the boundary of the Brazilian territory, as settled by a convention in 1817. Its length along the coast is about 230 miles, and its breadth 250; comprising an area of 27,560 square miles. The coast is an alluvial tract of great fertility; the high lands are also very fertile; and few countries are more abundantly watered. The coasts are low, and the sea so shallow that, except at the mouth of the river, ships cannot approach the shore. There is only one roadstead, that of Cayenne, where vessels can ride in security. The climate and natural productions are in every respect similar to those of British Guiana, with the addition of pepper, cloves, cinnamon, and nutmegs. The colony is divided into two districts, Cayenne and Sinnamary, and fourteen communes or townships. The government is vested in a governor, assisted by a privy council; and there is besides, the colonial council of sixteen members elected by the colonists; the public revenue amounted in 1837 to £9384, and the expenditure, to £60,279. The population in that year, besides the garrison and colonial functionaries, amounted to 21,648; of whom 5056 were free; the rest being slaves.

Cayenne, the capital, which is situate on the coast of a large island, about 18 miles in length by 11 in breadth, is strongly fortified, and a hill within the enclosure commands the whole town and the anchorage. It is an ill-built and ill paved town, and the greater part of the population are negroes or people of colour.

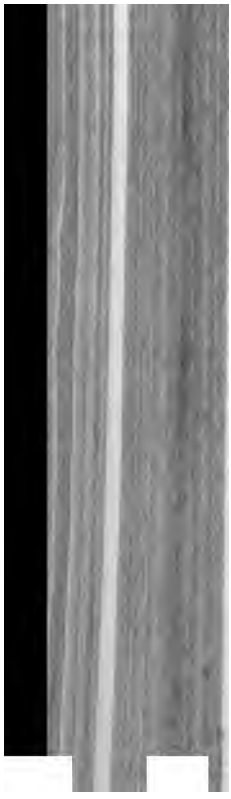
XVIII. *PATAGONIA*

Is an extensive region, forming the southern extremity of the continent, and stretches from the Rio Negro, between 39° and 40° S. lat., to the Strait of Magellan, in 52°, nearly 900 miles. The western part of the country is formed by the southern portion of the Cordillera of the Andes, which there approaches the sea, and forms a number of lofty islands and peninsulas, which line the coast from Chiloe to the Strait. The general elevation of the chain is only about 3000 feet. The character given of this western region is very unfavourable. Wood and water are indeed abundant everywhere; fish are easily caught, and ducks, geese, and other birds are numerous; but of any other useful productions the country is quite destitute. The forests are very dense, and the ground always wet, so that the country is uninhabitable by civilized man; though the climate is mild, and the temperature surprisingly uniform throughout the year. The eastern coast is comparatively low, and the country beyond it is undulating, with extensive pampas covered with grass, but destitute of trees. The soil is dry and sterile, as the westerly winds leave all their moisture on the mountains that line the coast; while easterly winds, which alone bring rain to Eastern Patagonia, are very rare. It is also exposed to severe cold in winter, and excessive heat in summer. Great and sudden changes of temperature take place, when, after very hot weather, cold winds rush northwards with the fury of a hurricane. The indigenous inhabitants are a tall and robust race. They possess no towns, but lead a wandering and unsettled life. (See PEOPLE.)

XIX. *ISLANDS OF AMERICA.*

The ARCTIC ISLANDS of America form a numerous group, between Hudson's Bay and Baffin's Bay; but being entirely barren, and only partially inhabited by a few wandering Esquimaux, we may pass them over without farther notice; though the exploring of them has been the object of many voyages, for the purpose of finding among them a north-west passage to China.

NEWFOUNDLAND is a large island which forms the eastern side of the Gulf of St. Lawrence, between 46° 49′ and 52° 30′ N. lat., being about 300 miles in length, by about 225 in its greatest breadth, and containing an area of 36,000 square English miles. The coast is indented by a number of deep inlets which afford commodious and secure harbours. The interior abounds in large lakes, and is traversed by considerable rivers. The surface, in general, is not heavily timbered; but there is no deficiency of wood. The climate is severe, and the winter long, while the coasts are often visited by cold and dense fogs; the heat of the summer is sometimes oppressive in the day time; but the mornings and evenings are temperate and agreeable. The island is however generally salubrious. The rich pasturages adapt it peculiarly to the rearing of cattle, and good barley and oats might be grown; most of the common



about 20,000 inhabitants.

The *Magdalen Islands*, are a group of small islands in the middle of the north of Prince Edward's Island. *Grand Miquelon*, *Petite Miquel* small islands belonging to France, near the southern coast of Newfoun the French fishers, of whom about 14,000 are employed on the Newfound a long ridge of sand, about 90 miles S.E. of the most easterly point of Ne shipwrecks. It is about 27 miles in length by one or two in breadth, a hillocks 130 feet high. The only vegetation is coarse grass, with some lo the way of vessels sailing to and from the British colonies, and the dem vail, and the extensive shoals which surround the island, make it extr dreaded. An establishment for the relief of shipwrecked mariners is kep

The WEST INDIES comprise five large, and about 40 smaller islands, be called cayos or keys, surrounded by or interspersed with coral reefs and sa between 10° and 28° N. lat., and 59° 30' and 85° W. long., and are generall named the *Lucayos* or *Bahamas*, the *Great Antilles*, and the *Lesser Antill*

The Bahamas comprehend fourteen principal islands, besides innumeral extending in line from the coast of Florida to near Hayti, about 750 miles pal islands are: *New Providence*; *Eleuthera*; *Abaco*; *Great Bahama*; *Gr rador* or *Cat island*, the first land seen by Columbus in his first voyage; *ling's Island*, *Crooked Island*, *Mariquana*, *Great Inague*, and the *Kayques* formation, low, flat, scantily covered with soil, and most of them are unin and agreeable. *Nassau* in New Providence is the seat of government, an

The Great Antilles are *Cuba*; *Haiti* or *Hayti*; *Porto Rico*; and *Jamaica*, a long chain, extending in a curved line from Porto Rico to the Gulf Windward Islands; and of a smaller and more scattered group along the called the Leeward Islands. But English writers give the latter name t the first group, from Dominica to the Virgin Islands, restricting the ap to those between Dominica and Trinidad. Their names are: The *Virgin* *Tortola*, *Virgin-gorda*, *St Thomas*, *St John's*, *Santa Cruz*; *Anguilla*, *St mew*, *St Eustatius*, *St Christopher's* or *St. Kitts*, *Nevis*, *Redonda*, *Montserr deloupe*, *Marigalante*, *Dominica*; *Martinique*, *St. Lucia*, *St. Vincent*, *Ba Grenadines*, *Tobago*, *Trinidad*; and on the coast of Venezuela, *Buenayre* the islands contain isolated peaks or mountain ranges, the summits of w attain a great elevation. St. Lucia, Martinique, Dominica, Guadeloupe, and St. Vincent are volcanic islands, and several of the craters have thrown the middle of last century. The volcanoes of the larger islands seem Caribbean islands are of secondary formation, and are not much raised The elevations of their principal mountains are:

Cuba,	Mount Potrillo,	
"	Sierra de Cobre (Copper Mountains),	
Jamaica,	Blue Mountains,

Porto Rico,	Sierra de Languilla,	

Numerous streams descend from these mountains, which, though they do

temperate regions. The spring may be said to commence in April, when a bright and beautiful verdure, with a rapid and luxuriant vegetation, makes its appearance; and, during May, gentle showers fall almost daily, breaking up with thunder-storms. From May till October, the tropical summer reigns in full vigour; and before the sea-breeze or the trade wind sets in, the heat is scarcely supportable. The sea-breeze begins in the forenoon between 11 and 12 o'clock, and blows with great regularity. The mean height of the thermometer at this season is 80°. The nights are beautiful, and are tempered by a land wind, which, especially in the mountainous islands, blows gently off the shore from about ten o'clock till daylight. With October commence the autumnal rains, when the water pours down in torrents. This continues till December, between which time and April, serene and pleasant weather prevails. From December till March the trade winds blow regularly from the east and north-east, diffusing a refreshing coolness. In March they begin to decline to the south-east, and decrease in strength; but they continue to blow, though with diminished force, till June, when they are often interrupted by calms. In August the hurricane season begins; these winds often do great damage in some of the islands; but they are rare in Cuba, and are never felt in Tobago and Trinidad. They happen most frequently in August, but also occur occasionally in July, September, and October.

The rich and varied productions of the West Indies give them an important place in the commercial world. To their valuable native plants art and industry have added others not less valuable. The sugar-cane, yielding its threefold tribute of sugar, molasses, and rum; the coffee plant, the pimento or all-spice, the plantain and the banana, the pine-apple, the anana, the yam, the sweet potato, maize, cassava, manioc; with cacao, tobacco, cotton, various dyewoods and stuffs, as fustic, logwood, indigo, cochineal; and medicinal plants, as liquorice-root, arrow-root, ginger, jalap, ipecacuanha; mahogany, and lignumvitæ, are among the vegetable productions. To this list must be added the bread-fruit, cocoa-nut, mango, papaw, guava, orange, lemon, tamarind, fig, cashew-nut, mammee, grenadilla, vanilla, pandanus, &c. The cattle are generally of diminutive size; only a few of the islands contain sheep and goats; few horses, asses, or mules are reared, and consequently great numbers of these animals are imported from the continent. Hogs are more abundant than other domestic animals. There are few wild animals, but wild swine, tajassoes, monkeys, rats, and some smaller animals. The manati is found in Trinidad and Tobago. The cayman and various other lizards, and snakes, are common. Fish and turtle are abundant. Parrots, flamingoes, and humming birds are also common. Musquitoes, cockroaches, centipedes, scorpions, ants, and chigos, abound in the islands.

The indigenous population of the islands has long been extinct, except a few hundreds in Trinidad. At the time of their discovery the southern islands were inhabited by the fierce and warlike Caribs; the more northern, by a gentler race, the Arrowauks. At present the population is European and African, partly pure and partly mixed. The negroes of pure race form nearly two-thirds of the whole; the whites are about one-fifth; and the mixed races, one-seventh. The population is diminishing; though in the Spanish islands the loss is continually supplied by importations from Africa. The following table contains the names, extent, and population of the principal islands:—

Havanna, the capital, situate on the north shore of the western departi
and most flourishing cities in the New World. Its fine harbour, capabl
ships, is strongly fortified ; and there are besides extensive arsenals and do
generally narrow, crowded, and dirty ; but the recently built suburbs are
of the churches are handsome. It still possesses about two-thirds of the
population in 1827 was 112,000, but has much increased since that time. Th
sidered unhealthy. *Matanzas* also on the north coast, 60 miles E. of H
commercial town ; it has a capacious and safe harbour, and 15,000 inhab
the most thriving towns on the south coast ; its harbour is capacious b
siderable, and its population about 12,500. *Puerto-Principe*, in the interio
of the island, is a poor, and ill-built, but large town, with 30,000 inhabitant
on the north coast, serves as its port. *Santiago* is one of the oldest an
island. Near the western extremity of Cuba, on the south side, is the *Is*
in diameter, a mass of high rocks, forming a bold shore, and rising toward
of more than 3000 feet. The mountains are covered with fine forests, bu
only to about 3000.

PORTO RICO is about 180 miles in length, by 36 in breadth. It is tra
ridge, with rich and beautiful, well watered and well wooded valleys on
stretch fertile alluvial plains, studded with thriving towns. The principal pr
molasses, rum, and tobacco ; the annual value of the exports is about 4,00
the imports, 3,000,000. *San Juan de Porto Rico*, the capital, is a large an
north coast, with a safe, capacious, and strongly fortified harbour, and 30,

HAYTI (formerly *Hispaniola* and *San Domingo*), situate between Cuba a
miles in length, by 150 in breadth. Several ranges of mountains cross th
are rugged and bare ; others being less abrupt, are covered with forests of
other valuable timber. Rich and beautiful valleys are interspersed among
are several extensive and fertile plains, which are watered by numerous r
table productions, and particularly the flora, are extremely rich. The prin
in the west and south, coffee, sugar-cane, and cotton ; in the north, coffee
some tobacco. The amount of the population is not known with any de
mates vary from 360,000 to 1,000,000, but there seems to be no means of ver
one-tenth of the whole are said to be coloured, that is, of mixed descent, the
whites ; but the great bulk are pure negroes. About four-fifths, comprisin
French part of the island, speak a language composed of French and sever

north coast, with 10,000 inhabitants, has a fine harbour, and is fortified; the streets are paved, and the site is agreeable. *San Domingo*, the oldest existing European city in the new world, founded in 1502, was formerly a flourishing town; and its wide, straight streets, its fine cathedral, handsome churches and convents, its hospitals, barracks, arsenal, and neat dwelling houses, still attest its former splendour. It has a good harbour, and a considerable trade; population, 10,000. The west side of Hayti forms a deep bay, in the middle of which is the large island of *Gonave*. Near the west end of the north coast is the small island of *Tortuga*, noted in the history of the Buccaneers.

JAMAICA is the largest and most valuable of the British islands. Its greatest length is about 150 miles, with an average breadth of 40. The Blue mountains, a lofty range, run through the length of the island; sending down upwards of two hundred rivers and streams to water its fertile savannahs and fine valleys. On the coast there are sixteen well sheltered harbours, besides thirty roads and anchorages. The climate has been considered unfavourable to Europeans; but much less so to the negroes. But that it is not naturally injurious to the human constitution, is evident from the long lives and good health enjoyed by both Europeans and negroes who live temperately. Of late years, too, the yellow fever has almost if not quite disappeared. Jamaica presents every indication of being of volcanic origin, but it contains no active volcano. The soil is generally deep and fertile. The chief articles of production and export are sugar, rum, molasses, and pimento, of which last, in 1832, 4,672,827 lbs. were exported. The value of the imports, of late years, has generally averaged £1,600,000 a-year; but great part of them are only sent to Jamaica as an entrepot for subsequent exportation to the Spanish main. Jamaica is divided into three counties: Middlesex, in the centre; Surrey, in the east; and Cornwall, in the west; and these are subdivided into twenty-one parishes. The executive power is vested in a governor appointed by the Crown, with a council of 12 members, who are appointed in the same manner. The legislative power is vested in a House of Assembly of 45 members, 2 for each parish, and 1 for each of the towns of Kingston, Spanishtown, and Port-Royal. The military force consists of about 3000 regular troops, with a white militia of 16,000 or 18,000 men. There is a rector for each parish, under a Lord Bishop, whose see includes also Honduras and the Bahamas. Education is somewhat widely diffused. The public revenue and expenditure amount to about half a million a-year. The governor's salary is £5560 a year; the bishop's, £4000.

Kingston, the principal town, stands on the north side of a fine harbour, in a beautiful plain near the east end of the southern coast of the island. It has an extensive trade, and about 30,000 inhabitants. Two miles N. is *Up-park-Camp*, the only government barracks, about 200 feet above the level of the sea, with comfortable accommodation for 1300 European soldiers. *Santiago de la Vega* (St. James of the valley) or *Spanishtown*, the seat of government, is situated in a fine valley 16 miles west of Kingston, and contains 5000 inhabitants. *Port-Royal*, situate on the tongue of land at the entrance of Kingston harbour, once a splendid and opulent town, has been at several times almost completely destroyed by earthquakes and fires; it still contains the royal dockyard, and is strongly fortified. On the west side of the entrance to this harbour, and on a low neck of land, is the fortress called *Fort Augusta*, a healthy station, with well-ventilated barracks. *Stonyhill Barracks*, capable of containing 500 men, are situate on a mountain ridge, 2000 feet above the level of the sea, 9 miles north of Kingston. *Bleuefields* and *Savanna la Mar*, in the western part of the island, are places of some trade. *Montego-bay*, on the north coast, is a considerable trading town, with 4000 inhabitants. *Falmouth* and *St. Ann* are villages on the same coast. The *Grand-Cayman*, the *Little-Cayman*, and *Cayman-braque*, three small islands to the north-west, are appendages to the government of Jamaica. Grand Cayman is the only one of them which is inhabited.

ST. CHRISTOPHER'S or ST. KITTS, is a long island, in shape resembling a guitar. In the interior of the northern part it is rugged and mountainous, its principal summit Mount Misery rising to the elevation of 3712 feet; but along the sea it contains a fine plain of great beauty and fertility. *Basseterre*, the capital, on the south-west coast, contains about 6000 inhabitants. The principal military station is *Brimstone Hill* on the west coast. *Nevis* is a small but beautiful and fertile island, lying close to the southern extremity of St. Kitts, and consists of a single conical mountain rising 3000 feet above the level of the sea, with a border of level land, possessing a very fertile soil, which produces excellent sugar. The only town is Charlestown, a neatly-built place, with a good roadstead. *Anguilla*, or *Snake Island*, is low and level, and contains a valuable salt pond. The Virgin Islands, belonging to Britain, are *Tortola*, *Virgin-gorda* or *Pennistan*, *Anegada* or *Drowned Island*, the last of which is so low, that the sea sometimes breaks over it, and is surrounded by a dangerous reef. Tortola consists of a mountain mass, with a few tracts of flat ground along the shore, and has a town of the same name, on a fine harbour. All these are included in the government of St. Kitts.

ANTIGUA is tolerably level and well cultivated; a range of hills called the Sheckerly mountains, rises in the south and west, to the elevation of 1500 feet; but the only other irregularities of the surface are slight elevations, broken grounds, and a few water courses. The climate is healthy; but the island is subject to great droughts, and is deficient in springs and brooks. It is nevertheless a valuable island, and has a great number of excellent harbours; but, as it is almost surrounded by reefs and shoals, the approach is difficult except on the south-west. *St. John's*, the capital, on the north-west coast, is much admired for the beauty of its situation and its neat appearance. It contains about 16,600 inhabitants, and derives importance from its being the station of the Governor-General of the Leeward Islands. On the south coast is the important naval station of *English Harbour*, containing a royal dockyard. *Montserrat* derives its name from its rugged appearance, and is more noted for its picturesque beauty than for its productiveness. It consists of a mass of rocky hills diversified with valleys. Part of the coast is rendered inaccessible by coral reefs, and there is no harbour. *Plymouth*, a neat little town, is the capital.

DOMINICA is a large and fertile island, though some parts of it are very rugged. The valleys and plains are watered by about thirty rivers and numerous smaller streams. The island is of volcanic origin, and contains several Soufrieres or volcanic vents, which throw out sulphur. Sulphureous and thermal springs are also numerous. High mountains, considered to be the loftiest in the Antilles, occupy the central parts; their slopes are very steep, and terminate in bold and precipitous coasts. The climate is unhealthy. *Rosseau* or *Charlottetown*, the capital, is a well built town, with 4000 inhabitants; but its roadstead is unsafe in the hurricane months. Prince Rupert's Bay, farther north, affords a roomy, deep, and safe harbour.

ST. LUCIA is a mountainous island, the high peaks of which at the south-west extremity, called Pitons by the French, and Sugar-loaves by the English, are visible at some distance, and form striking objects at sea. The range of hills to which the Pitons belong, contains an active volcano, the last eruption of which took place in 1812; but its crater, 4000 feet above the level of the sea, contains hollows filled with boiling water and mud. The soil is fertile, but the climate is moist, variable, and unhealthy. There are several good anchorages; and *Port Castries* or *Carenage*, is one of the best harbours in the West Indies. The town of the same name has a population of about 5000. The population of the island is French.

ST. VINCENT is the most beautiful of the Windward Islands. The mountains are bold and lofty, and the valleys highly productive. In 1812 the Soufriere, which had long been quiescent, threw out ashes and scoriæ, together with a stream of lava. The climate is exceedingly humid; but the island is nevertheless comparatively healthy. *Kingston*, the capital, is a neat town, with 7000 inhabitants. *Calliaqua*, on the south side of the island, is a little village with a fine commodious harbour.

best kind, and produce peaches, oranges, grapes, melons, and figs, besides the ordinary tropical fruits. They were discovered in 1522, by Juan Bermudez, a Spaniard, from whom their common name is derived. In 1609, Sir George Somers, on his voyage to Virginia, was wrecked on them, from which circumstance they obtained their other but less usual name.

Off the coast of Brazil are the *Abrolhos*, a cluster of islets and banks, between 17° and 18° S. lat. The islands are low, and are covered with grass and a little scattered brushwood. They consist of gneiss and sandstone in horizontal strata, and their highest point rises about 100 feet above the level of the sea. *Fernando Noronha* is a small island used as a penal settlement by the Brazilian government, in S. lat. 3° 52′, and W. long. 32° 25′. *Martin Vas* is a group of very small islands; and *Trinidade* is a larger island, between 32° and 35° W. long., and about 20° 30′ S. lat. *St. Catherine's* is a considerable island close to the coast, between 27° and 28° S. lat., forming, inside, a good harbour and anchorage.

The FALKLAND ISLANDS, a group in the South Atlantic, occupied by Great Britain, but claimed by Buenos-Ayres. There are said to be so many as 200 islands; but only two of them are of considerable size. They are situate between 51° and 52° 45′ S. lat., and 57° 20′ and 61° 46′ W. long., about 250 miles N.E. of Tierra del Fuego. The islands are all of very irregular shape, and much indented with bays and inlets, and contain many excellent harbours. Between the two large islands is Falkland Sound, from 7 to 12 miles in width, and navigable for ships of any class. The shores are for the most part low; but in the western part of the group, there are many high precipitous cliffs, and ridges of rocky hills, about 1000 feet above the level of the sea. The highest hills, which are in the eastern large island, rise about 1700 feet. The climate is variable, though not quite so much so as that of England, and is said to be quite as healthy. Snow seldom lies long, and the frosts are slight; but the winds are violent and excessive. A small British garrison is stationed at *Port Louis*, at the head of Berkeley Sound, towards the north-east extremity of the eastern island. There are also a few Buenos-Ayreans and Europeans; and the islands are frequented by numbers of Americans, English, and French whalers and sealers.

TIERRA DEL FUEGO (Land of Fire) was the name given by the early Spanish navigators to the country which forms the southern side of the Strait of Magellan. Its coasts have been recently surveyed, and it has been found to consist of seven large, and many smaller islands and rocks, separated by channels of various widths. *Cape Horn*, the most southerly of the group, is a small island, rising 1870 feet above the level of the sea, in S. lat. 55° 58′ 40″, and W. long. 67° 16′; and the eastern extremity is *Staten Island*, which forms the eastern side of the celebrated *Strait of Le Maire*. The southern and western parts of the tierra may be briefly described by saying, that deep but narrow arms of the sea intersect high mountainous islands, whose summits are covered with snow, while their steep and rocky shores are more than partially covered with evergreen wood. In the eastern portion the wooded mountains of the west sink into hills, and these again into level land, which is partially wooded. Throughout the year, cloudy weather, rain, and much wind prevail; fine days are rare; frost and snow are constant on the mountains: but near the level of the sea, neither the frost nor the snow is so severe as might be expected in so high a southern latitude, and in the vicinity of snow-covered mountains. The climate of the eastern portion is somewhat milder than that of the western. The country is thinly inhabited by the wretched Pecheres.

Along the west coast of Patagonia are innumerable islands and peninsulas, all much of the same character as the worst parts of Tierra del Fuego, forming the upper parts of a great range of mountains, whose bases are sunk in the ocean. They are barren to seaward, but impenetrably wooded towards the mainland; and are always drenched by incessant rain, which is never dried up by evaporation. Clouds, winds, and rain only cease during the very few days on which the wind is easterly or perhaps southerly. But the climate is mild, and the temperature is surprisingly uniform throughout the year. The principal of these islands are *Wellington*, *Cambridge*, *Adelaide*, *Hanover*, *Rennel*, *Piazzi*, *Chatham*, *Madre de Dios* (God's Mother;) with the peninsulas of *Taytao* and *Tresmontes*.

Chiloe is a large island, forming the most southern province of Chili, and the last inhabited part of the west coast of South America. It is about 120 miles in length by 40 in breadth; population of it and 36 adjacent islands, about 50,000. The island is mountainous and covered with wood; and the climate is healthy but damp. It feeds great herds of sheep, hogs, cattle, horses, and other animals; and the principal articles of export are planks, hams, brooms, hides, woollen cloths, &c., to the value of 25,000 dollars a-year. The chief towns are *San Carlos*, which is fortified, and has a population of 2000; *Castro*, and *Maulin*. To the southward extends the long *Chonos Archipelago*, the physical character of which is little better than that of the South Patagonian Islands. It is almost uninhabitable. Indeed, to the south of Chiloe there are very few acres of land capable of cultivation, and no place which is fit for the permanent abode of civilized man.

Mocha, a small island off the coast of Chili, in south lat. 38° 19′, is high, with deep water round it, but straggling and dangerous rocks lie near it towards the south-west. A few Chilenos live on it for the sake of catching seals on the rocks.

The ISLANDS OF JUAN FERNANDES, discovered by a Spaniard of that name in 1563, consist of two principal and several smaller islands in the Pacific Ocean, 400 miles W. of the coast of Chili, in 33° 40′ S. lat. The larger island named *Mas-a-tierra* (nearest land), is from 10 to 12 miles long and 6 broad, elevated in the north; less lofty, but rocky and barren in the south. The fig and the vine flourish on the hill sides; and, among the larger trees, are the sandal, cork, and a species of palm called chuta, which bears a rich fruit. Goats are found in a wild state in the interior; seals, walrusses, and crustacea, on the coasts. The island has been taken on lease from the Chilian government by an American, who has brought to it about 150 families of Tahitians, with the intention of cultivating it, so as to make it become the resort of whalers and other vessels navigating the Pacific. Off its south-west point is the small island of *Santa Clara* or *Goat Island*. The smaller island, named *Mas-a-fuera* (farthest out), is a lofty volcanic rock, 90 miles farther west. The highest mountain of Mas-a-tierra is 3000 feet, and the summit of Mas-a-fuera is 2300 feet, above the level of the sea.

The *Isles of St. Felix* are a small group, between 25° and 26° S. lat., and 79° and 81° W. long.

The GALAPAGOS are a group of volcanic islands, situate under the equator, between 89° and 92° W. long. They are all of comparatively recent formation; and the lava is very hard, so that vegetation makes small progress. On five islands there are fertile spots, at one of which, on Charles's Island, a small colony has been established by the government of Guayaquil. There are six principal and seven smaller islands, besides many islets and rocks. The largest is 60 miles in length, and 15 broad; and its summit rises 4000 feet above the level of the sea. At first landing on their shores, dismal looking heaps of broken lava everywhere meet the eye, with innumerable crabs, hideous iguanas, and great elephant tortoises. The two latter species of animals are peculiar to the islands; and, indeed, it is from the last that the group derives its name of *Islas de las Galapagos* or Islands of Land Turtles.

The *Isles of Revillagigedo*, between 18° and 20° N. lat. and 109° and 115° W. long., west by south of Cape Corrientes in Mexico, are four in number, named *San Benedicto*, *Del Socorro*, *Rocca-partida*, and *Santa Rosa*. They are almost in the same line of latitude with the volcanoes of Colima, Jorullo, Popocatepetl, and Orizaba; and pumice stones are found among them, proving them to be of volcanic origin. To the north-west is a small island named *Shelvock's*, about 200 miles south-west of Cape St. Lucas in California. *Clipperton's Island*, and *Gallego*, are two small islands between those of Revillagigedo and the Galapagos; the former in 10° 20′ N. lat., and the latter in 1° 40′ N.

Nootka, named also *Quadra* and *Vancouver's Island*, is a large island close on the coast of North America, to the north of the Columbia river, and crossed by the 50° N. lat. It is separated from the mainland by Queen Charlotte's Sound, and the Strait of Juan de Fuca. It contains about 30,000 square miles; is rocky and elevated, but no part of it attains any great height. The coast farther north is lined by a number of large islands, bearing the inappropriate names of *Queen Charlotte's*, *Prince of Wales's*, and such like.

THE ARCTIC POLAR REGIONS.

North America and the islands connected with it may be considered as terminating at Lancaster Sound, which extends about 500 miles westward, and forms a wide separation between them and the regions which constitute the northern and eastern sides of Baffin's Bay. The country immediately adjoining Lancaster Sound, seems to consist of a number of large islands or peninsulas, separated by wide straits; but towards Baffin's Bay there seems to be a continuous mass of land, extending northward to Sir Thomas Smith's Sound, which forms the north-western limit of Greenland. This land has been called *North Devon*, and the islands to the westward, *Parry's Islands*; the most westerly of them yet known being *Melville Island*, where Captain Parry wintered in 1819-20. The shores consist of steep rocks, while the interior is occupied by mountains always covered with snow. North Devon seems to be uninhabited; but Parry's Islands contain a few families of Esquimaux.

GREENLAND appears to form one continuous mass of land, extending along the eastern side of Baffin's Bay, from Cape Farewell, in 60° N. lat., to Smith's Sound, in 78°, more than 1260 miles; and expanding in width from Cape Farewell to the most northerly part known, where the breadth exceeds 600 miles. It is a barren mountainous country, nearly the whole surface of which is covered with perpetual ice and snow; which in many parts form glaciers extending to the very shores, where they appear as icy cliffs, several hundred feet high. The eastern coast generally rises in high masses of rock or ice, close to the shore, and is beset during the whole year with enormous masses of ice, which render the vegetation exceedingly scanty, and the fishing very precarious. Accordingly, only a few Esquimaux inhabit it. The western shores are high, rugged, and barren, but are indented by deep inlets, some of which penetrate 100 miles, and on the sheltered low grounds along their banks there is some vegetation; the sea being less encumbered with ice than on the east coast, the inhabitants are able to prosecute, for a considerable period during summer, the fisheries, on the produce of which they subsist. The climate is also less severe, though the ground does not begin to thaw till the end of June; but in July the thermometer rises to 92°. The atmosphere is pure, light, and healthy; but in winter the cold is sometimes very intense. The vegetation in the northern districts consists of lichens and mosses; but, farther south, there are a few annual plants, and some berry-bearing shrubs. In well-sheltered valleys birch and mountain-ash grow to the height of a man, with a stem three or four inches thick. Potatoes, and a few other culinary vegetables, are raised; and a few sheep are kept by the European settlers. Rein-deer, hares, foxes, and white bears, are the only wild animals; and the only domestic animal possessed by the natives is the dog, which they use for drawing sledges. Sea-fowl and fish, especially cod and caplin, are plentiful; but seals supply the most essential wants of the natives, with their fur, skins, and oil. The inhabitants are Esquimaux, who live on the west coast, as far north as 77° N. lat. and on the east coast to 76°. Their principal occupations are fishing and seal-hunting; they are under the dominion of Denmark, forming 13 colonies, with 15 minor commercial and 10 missionary establishments; the most northern station is *Upernavic* in N. lat. 72° 30'. Many of the people have embraced Christianity, and are becoming somewhat civilised; though the circumstances in which they are placed must ever operate as a bar to their great improvement. The trade between Greenland and Denmark employs five or six vessels. The exports consist chiefly of whale oil, seal, bear, and rein-deer skins, eider down, &c. Coffee, tobacco, snuff, and brandy, are the principal articles of import. The total population is estimated at between 6000 and 7000 Esquimaux, and 150 Danes or other Europeans.

BAFFIN'S BAY, and DAVIS' STRAIT, which divide Greenland from America, extend in the direction of N. by W. from the North Atlantic Ocean, for 1300 miles, with a breadth varying from 160, at the narrowest part of Davis' Strait, under the Arctic Circle, to about 900 miles, opposite Lancaster Sound. This great sea is navigable only in June, July, August, and September; navigation during the rest of the year being rendered impossible by icebergs. It is of great but variable depth, with a muddy bottom. There are strong currents which set towards the south in Davis' Strait, but in the upper part of the bay they seem to run north. Indeed, it is said that a strong current sets in from the ocean round Cape Farewell, and continues along the eastern coast to N. lat. 67°, where it crosses over to Cape Walsingham, and thence flows southward along the western shores of the bay, and those of Labrador and Newfoundland. The black whale is very abundant in these seas, on which account they are visited every summer by a great number of whaling vessels, which, since Captain Parry showed them the way, even cross the Bay and penetrate Lancaster Sound. Davis' Strait was discovered by John Davis in 1596; Baffin's Bay, by Robert Bylot and William Baffin in 1616; but it was not till the summer of 1818 that they were again followed in their track round the bay. These seas are remarkably free from islands and rocks. The largest is *Disco Island*, on the east coast, in 70° N. lat.; and *Hare* or *Waygatt Isle*, a little farther north, has acquired some celebrity, as the place where experiments have been made with the pendulum to ascertain the figure of the Earth.

The SPITZBERGEN (Peaked Mountains) are a group of four large and many smaller islands in the Arctic Ocean, to the eastward of Greenland, between N. lat 76° and 81°, and 7° and 27° E. long. Their shores are no where flat; but, on the contrary, in every direction, consist of conical mountains which rise abruptly from the sea to an elevation of between 1500 and 3700 feet, being separated by narrow valleys, which generally open to the sea, and are all occupied by glaciers. In summer, streams of water flow from some of them, and form cascades; but, in general, the glaciers are covered with snow all the year. Not a plant deserving the name of tree or shrub enlivens the desolate scene; and of the 47 species of plants which the country produces, most are mosses and lichens. The arctic fox is the most common quadruped; but there are also white bears, rein-deer, and numerous sea-fowl. The surrounding seas teem with life; with whales, seals, walrusses, cod, ling, herring, torsk, and skate; but the most abundant marine animals are of the molluscous and crustaceous classes. The climate is intensely cold; but the atmosphere is pure and dry, and so serene and refractive, that objects are clearly seen through it at vast distances. The dominion is claimed by Russia, and a few Russian hunters continue on the islands, even during winter, to pursue the seal and the walrus. To the southwest of Spitzbergen, nearer the coast of Greenland, is the rocky island of *Jan Mayen*, which rises to an elevation of 7000 feet above the level of the sea, and contains an active volcano.

OCEANICA OR OCEANIA.

THIS name has been employed by the French geographers, and adopted by those of other nations, to include the innumerable islands scattered over the great ocean which extends from the south-eastern shores of Asia to the western coast of America. From Asia, Oceania is separated by the Gulf of Martaban, the Strait of Malacca, the Chinese Sea, the Channel of Formosa, and the sea to the south and east of Japan; and from America, by the wide expanse of ocean, which is free of islands, between the western shores of that continent, and the most easterly parts of Polynesia. Oceania may be divided into three distinct portions, which we shall treat of separately, under the names of *Malaysia* or *Malaisia*; *Australasia*; and *Polynesia*.

I. MALAYSIA.

GENERAL DESCRIPTION.—Malaysia includes the numerous islands immediately adjoining the south-eastern coasts of Asia, to which they have been hitherto usually considered as an appendage, under the name of the *Indian Archipelago*. The group has been named *Malaysia* from the circumstance, that almost without exception people of the Malay race possess the coasts, at least of all the large islands, and are, indeed, the dominant race of the Archipelago. It is situate between 12° 40′ S., and 20° N. lat., and 92° and 134° E. long. The Archipelago is arranged into groups and chains of islands, which, being thickly strewed, form numerous straits and passages, the intricacy of which would render the navigation dangerous, were not the seas distinguished beyond all others, by the proximity of large tracts of land, by their pacific character, and by the uniformity of the prevailing winds and currents. The whole of Malaysia is situate within the tropics. There is accordingly a great uniformity of climate, of animal and vegetable productions, and in the character of its inhabitants. It possesses the common characteristics of other tropical countries; heat, moisture, and luxuriant vegetation. The islands are throughout of a mountainous nature, and the Archipelago is traversed by several great lines of volcanic action. From Luzon, where there are three active volcanoes, one line extends through Mindanao, Sanguir, the north-eastern extremity of Celebes, Gilolo, and the Moluccas, where it is met by two other great volcanic lines, the one of which extends east and west from Barren Island in the Gulf of Martaban, through Sumatra, Java, Bali, Lombok, Sumbawa, Sandelwood, and others, and the other stretches through Borneo, Celebes, Banda, with New Guinea, New Britain, New Ireland, and various other islands of Polynesia. The islands contain few plains, and no arid deserts. Where not cultivated, they are generally covered with forests of stupendous trees. They are distinguished from every other group of islands in the world, by the presence of periodical winds; and from all countries whatever by the peculiar character of these. If not the most extensive, Malaysia is at least the most widely spread region, and the region of the most curious and various productions in the immediate neighbourhood of the equator. The insularity of the region, the contiguity of the islands, and the facility and rapidity of the navigation, are also prominent and characteristic features. The animal and vegetable productions either differ wholly from those of other countries, or consist of important varieties of them; and the productions of the intervening seas are not less remarkable for their abundance and variety than those of the land.

There is, however, much diversity in the physical character of the islands and their inhabitants: the whole are capable of being classed under five natural divisions. Beginning from the west, the first division comprehends Sumatra, Java, Bali, Lombok, and about two-thirds of the western portion of Borneo, as far as 116° E. long. The animal and vegetable productions of this division are peculiar, and have a higher character of utility than those of the other divisions; the soil is more fertile, and better suited for rearing vegetable food of the highest quality. The civilized inhabitants have a general similarity in manners, language, and political institutions; they

are much more civilized than those of the other divisions, and have made consider progress in arts, arms, and letters. Rice is their principal food, and is gener abundant. Celebes is the centre of the second grand division, which compreher besides that great island, the smaller islands on its coast, as Boutong and Salaye whole chain of islands from 116° to 124° E. long., with the east coast of Borneo to 3° N. lat. The animal and vegetable productions have generally a peculiar cha ter; the soil is less fertile than that of the first division, and less adapted for pro cing rice or other grain of the first quality. The civilized inhabitants have m considerable progress in the useful arts, but their civilization is of an inferior kin that of the first division. In language, manners, and political institutions, there surprising similarity among them, but they differ widely from their western neighbo Rice is their principal food, but is not abundant, and sago is occasionally used. T third division, which extends from 124° to 130° E. long., and from S. lat. 10° to lat. 2°, differs remarkably from all the rest. The character of the monsoons is h reversed. The eastern monsoon, which is dry and moderate to the west, is here ra and boisterous; the western monsoon, which is rough and wet in the first two divisio is here dry and temperate. The greater number of the plants and animals of the first t divisions disappear in the third, which possesses remarkable productions of its ow unknown in any other part of the world. This is the native country of the clove a the nutmeg, and the only region that produces them in perfection. For raising t higher kinds of vegetable food the soil is less suited. Rice is scarcely produced all, and the staple food of the people is sago. In language, manners, and institution the people agree among themselves, but differ essentially from their neighbour They are far inferior in knowledge, skill, and civilization, to the people of the fir two divisions; and have never acquired the use of letters. The fourth division the least distinctly characterized; but it is nevertheless marked by points of dissimil tude sufficiently striking to entitle it to be considered separately. It extends fro 116° to 128° E. long. and from 4° to 10° N. lat., including the north-eastern coas of Borneo, the large island of Mindanao, and the Sooloo archipelago. The clove an the nutmeg are indigenous, but of inferior quality; sago is much used, but rice is th principal food of the inhabitants. In civilization the people are superior to those o the third division, but inferior to those of the first and second. Their language, man ners, and institutions are peculiar, agreeing with each other, but differing from thos of all their neighbours. The fifth division is the well known group of the Philippine which extend from 10° to 15° N. lat. A geographical position so different from tha of all the other countries of Malaysia occasions much difference of climate and natura productions. It is the only portion of Malaysia within the region of hurricanes, an this circumstance alone gives a peculiar character to the country. The soil is of ex nent fertility. It is particularly favourable to the growth of tobacco and the sugar cane, but does not produce the pepper of the first division, the spices of the third nor the delicate and peculiar fruits which characterize the islands within 10° of th equator, and are unknown to all other regions of the earth. The manners, cus toms, and institutions, and, above all, the language of the people, differ from thos of the inhabitants of all the other divisions. Rice is the food of the more civiliz races.

PEOPLE.—These distinctive features have necessarily produced the most extensiv influence on the character and civilization of the inhabitants. The most abject race only, those secluded from the sea, are hunters; there are no pastoral tribes; and a migrations are made by water. Their boats and canoes are to the Malays what the horse and the camel are to the Tartars and the Arabs; the people are by necessity navigators and fishermen, and from this condition the progress of civilization among them is to be traced. Predatory warfare is the only kind suited to their genius.

The inhabitants consist of two perfectly distinct races; the one fair or brown coloured, with lank hair; the other black or sooty coloured, with woolly or frizzle hair. The brown coloured tribes agree so remarkably in appearance with each other, that one general description will suffice for all; and the varieties may gene rally be considered as objects of curious rather than of useful distinction. The persons are short, squat, and robust. Their medium height may be reckoned, fo the men, about five feet two inches, and for the women, about three inches less Their complexion is generally brown, but varies a little in different tribes; neithe the climate nor the habits of the people seem to have any effect upon it. The fairer races are generally towards the west, and some of them, as the Battas of Sumatra, ar under the very equator. The Javanese, who live the most comfortably, are among

the darkest people of this race; while the wretched Dayaks or cannibals of Borneo, are among the fairest. The hair of the head is long, lank, harsh, and always black; on every other part of the body the hair is scanty; the beard in particular is very defective. The Mahometan priests among them are fond of wearing beards, but the utmost they can obtain by great care and assiduous culture, is a few straggling hairs, which only serve to make them ridiculous. The rest of the community pluck out what no pains would render respectable. Compared with Europeans, Arabs, Persians, Tartars, Burmans, and Siamese, they may be considered as an ill-looking race. They most resemble in person and complexion the people of Siam and Ava; but nevertheless differ essentially from these, and are, in short, a distinct race, maintaining among themselves a remarkable congruity, but are, at the same time, very unlike any other people. Their standard of perfection in colour is virgin gold; but their complexion is scarcely ever clear, and a blush is hardly at any time discernible in it. This circumstance, however, distinguishes them from Europeans more than from Asiatics.

The Pua-puas, Papuas, or woolly-haired race, resemble dwarfish African negroes. Mr. Crawford says that he never saw any of them whose stature exceeded five feet, and he has seen full-grown men of only four feet nine inches. Besides their short stature they have spare and puny frames; and their complexion is of a sooty colour. Sir Everard Home draws the following distinction between them and Africans:—"The skin (of the Pua-pua) is of a lighter colour; the woolly hair grows in small tufts, and each hair has a spiral twist. The forehead rises higher, and the hind head is not so much cut off. The nose projects more from the face. The upper lip is longer and more prominent. The lower lip projects forward from the lower jaw to such an extent that the chin forms no part of the face, the lower part of which is formed by the mouth. The buttocks are so much lower than in the African negro as to form a striking mark of distinction; but the calf of the leg is as high as in the African. It is only, indeed, in the mere exterior stamp that the puny negro of Malaysia bears any resemblance to the African, who, in vigour of frame, and capacity for endurance, is superior to all the Asiatic and American races. The Pua-puas are evidently a distinct variety of the human species, and a very inferior one. Their puny stature and feeble frames cannot be ascribed to the poverty of their food, or the hardships of their condition; for the brown races, who live under circumstances equally precarious, have vigorous constitutions. Some islands, indeed, they enjoy almost exclusively to themselves, yet they have in no instance risen above the most abject state of barbarism. Whenever they come in contact with the fair race, they are hunted down like wild beasts, and driven to the natural fastnesses of the mountains. Those of them, however, who inhabit New Guinea and the islands to the eastward, though hideous in appearance, are said to be robust men of a shining black complexion."

The question of the first origin of both of these races appears to Mr. Crawford to be one far beyond the compass of human reason. "By very superficial observers," he says, "the one has been supposed a colony from Africa, and the other an emigration from Tartary. Either hypothesis is too absurd to bear the slightest touch of examination. Not to say that each race is radically distinct from the stock from which it is imagined to have proceeded; the physical state of the globe, the nature of man, and all that we know of his history, must be overturned to render these violent suppositions possible."—(*Hist. Ind. Archipelago*, I. 27.)

Such was the result of Mr. Crawford's inquiries; but later and more minute researches have established the existence of a third race of Malaysians, as black as the Papuas, or nearly so, but with straight or lank hair, and different features, sometimes resembling those of the Hindoos. They seem, however, generally to be of the same lineage and physical character as the Australians, and to be the aborigines, or oldest known inhabitants of the larger islands. They are every where extremely barbarous; and, where not reduced to slavery, the different tribes retain a general similarity in their habits of life. They are termed *Alfourous*, *Arafuras*, *Araforas*, or *Haraforas*, and speak a great variety of languages. They are found in New Guinea, the Moluccas, Celebes, and the Philippines; the barbarous people of the interior of Borneo belong, in part at least, to the same race; and the savages of the interior of Sumatra are probably a tribe of the same description.

For a people below the middle size of Europeans, and living almost solely on vegetable food, the brown Malaysians are strong and athletic; not agile and active, but persevering. They are uncleanly in their habits and persons, but temperate and even abstemious in their diet. They may be considered industrious or indolent in proportion to their degree of civilization or barbarity. Wherever they enjoy tran-

quillity and security they are found to be industrious like other people in the sa circumstances. Their frames are suited to the climate they live in; they have constitutional listlessness or apathy; and, whenever they have a reasonable pr spect of advantage, they labour with vigour and perseverance. But, as civilizati among even the most improved is but in an early stage, and even their best forms government are wretched, and confer little security of person or property, their ch racter feels the influence, and they may all be pronounced an indolent race, many them approaching to listlessness and apathy. They are gifted with a large portion fortitude, but their courage consists rather in suffering with patience, than in brav danger. With respect to their intellectual faculties, they may be pronounced sl of comprehension, but of sound, though contracted judgment. In quickness, acutene and comprehensiveness of understanding, they come far short of the civilized nations Europe, and in subtlety they are not less inferior to the Hindoos and the Chine Their weakness of reason and pruriancy of imagination make them wonderfully cr dulous and superstitious. But though their faculties are feeble, they are not perverte by false impressions, nor distorted and diseased by the influence of false refinement a erroneous education, like those of most of the Asiatic nations; while they posse an abundant share of laudable curiosity, with an anxious desire for knowledge. Th are also honourably distinguished from the Asiatics by a regard for truth; they ha no capacity for intrigue, and have never been known at any time to pursue those de terous expedients, and cunning practices, in which the whole lives of some Asiati are so frequently spent. They are capable of attachment, gratitude, and fidelity; a grave, reserved, cautious, courteous, and obsequious; but neither litigious, avaricio nor rapacious, though sufficiently tenacious of their rights. They are not cruel a unfeeling; in their legal punishments there are no symptoms of refined cruelty, th origin of which can be traced to their own manners; they are good-humoured and che ful to a remarkable degree, and very slightly irascible; and hospitality is almost unive sally practised. But, on the other hand, the absence of public security, and of a regul administration of justice, leaves in a great measure in the hands of private persons th power of avenging injuries; and, accordingly, every man has arms in his hands. Th point of honour is, in consequence, often as much observed by the peasant of Malaysi as by French or English gentlemen. In their demeanour there is a large share of natur politeness; among the more scrupulous, a contemptuous or haughty manner, still les an abusive expression, or a blow, will not be tolerated for a moment; the kris is ever hand ready to avenge the insult. Every man knows this, and the consequence is guarded demeanour and a universal politeness. All the tribes of the Archipela pride themselves in this, and never suffer an indignity even to a stranger who coul not defend himself. They are neither bigoted nor intolerant, with respect to any cla of opinions or practices, whether civil or religious. They bear no rancour towar strangers, but readily tolerate their peculiar manners, customs, and forms of religio They are, however, simple, credulous, and superstitious; it would require a volum says Mr. Crawford, to describe all the forms under which these weaknesses are di played. They believe in dreams, omens, lucky and unlucky days, casting of nativitie supernatural endowments, invulnerability, sorcery, enchantments, charms, filtre and relics. There is not a forest, a mountain, a rock, or a cave, that is not suppose to be the habitation of some invisible being; and, not content with their own stoc of these, their comprehensive faith has admitted the deities of Western India, Arab and Persia. These superstitions are generally harmless; though, at times, their de lusions operate in the most formidable manner. But over all their good qualities an weaknesses, revenge, the vice of all barbarians, is predominant. They can hardl forgive an injury, and are capable of harbouring the longest and most deeply-roote resentment; and in seeking to gratify this feeling, they sometimes break out into tho fits of furious madness, which have become proverbial under the name of amo where the madman assails all who come in his way till he is himself cut down. An ther vice, incident to their state of society, is a disregard for human life. They li in a state of turbulence and anarchy; the power of the law is scarcely felt; death familiar to them; and the great body of them are in such a state of degradation, th life is neither valued nor valuable; every man's life has its price, and that not a ve high one; murders and assassinations are common. In their social and domest state, thefts and robberies are extremely frequent; but these crimes are general perpetrated only by the meanest and most abandoned of the people; and even th common peasantry are remarkable, more generally for honesty and fidelity than f the opposite vices. But, in their intercourse with strangers and enemies, the treache of the Malaysian character is fully displayed. Of all the people of the East, wi

whom Europeans have had an extensive commercial intercourse, the Malaysians are by far the most uncivilized and barbarous. The singular value of the productions of their country, and its peculiar convenience for trade, have occasioned an extent of intercourse scarcely compatible with their state of civilization; the results of which are those acts of piracy and other lawless attacks on the property of strangers, which are insiduously perpetrated in accordance with the aggressive spirit of all people in such a state of society. Among a hundred nations of independent barbarians, the plunder of the stranger and the traveller are no more looked upon as crimes, than among the Arabs; while, on the other hand, as among the latter people, the same stranger, if destitute and forlorn, would find an hospitable reception.

Marriage is universally observed; and the lot of the women may, on the whole, be considered as more fortunate than in any other country of the East. They are, in general, not immured at all; and when they are secluded, the seclusion is but partial, and is free from that jealous restraint which has become proverbial with Asiatic manners. The husband invariably pays a price for his wife; but nevertheless women are not treated with contempt or disdain. They eat with the men, and associate with them in all respects on such terms of equality as are surprising in that state of society; and this equality is most thoroughly recognised among the most warlike tribes; women are frequently raised to the throne, and the practice is most frequent where the society is most turbulent. Polygamy and concubinage are tolerated; but may be looked upon rather as a vicious luxury of the great, than as a general practice. With respect to female purity there is the greatest difference of manners and opinions among them, some of the tribes being very lax, while others are the reverse; though jealousy cannot be said to be a vice belonging to any of them.

With respect to the amount of the population of Malaysia there are no data upon which any estimate can be formed. M. Balbi has arranged the Malaysians according to their languages, as in the following table:—

The JAVANESE, who seem to be the most numerous, as they form two-thirds of the population of Java, may be regarded as the most polished people of Oceania, while their literature is the richest and most important. They have been at three different epochs the preponderant nation of Malaysia: the first of which was towards the second half of the fourteenth century, when the empire of Majiapahit embraced almost the whole of Java, the kingdom of Palembang in Sumatra, the island of Bali, and the petty states in the southern part of Borneo; the second, in the first half of the fifteenth century, when their dominion extended not only over all Java, but also over Sabrang, Goa, Macassar, and others in Celebes, Banda, Sumbawa, Ende, Timor, Sooloo, Ceram, a part of Borneo, and Palembang in Sumatra; and the third, in the first half of the seventeenth century, when the empire of Mataram nearly equalled that of Majiapahit. The intellectual character of the Javanese ranks lower than that of almost any other people who have made equal progress in external circumstances, and their literature, like their religion, is almost entirely derived from Southern Asia, and exists in a very low and precarious state.

The *Mountaineers* of Bantam, Batavia, Buitenzoorg, Preangan, and Cheribon, occupy a large portion of that part of Java named *Sunda* by the natives.

The *Islanders of Bali* are among the most polished people of Oceania, although without an indigenous literature. Their religion and institutions are a faithful representation of those which formerly prevailed over all Malaysia, and particularly at the court of Majiapahit.

The *Malays* occupy the late empire of Menangcaboo, Siak, Palembang, and other parts of Sumatra; the islands of Lingen and Bintang, the greater part of the coasts of Borneo and the Moluccas, and the chain of islands extending from Sumbawa to Timor. They possess a literature as rich as that of the Javanese, though less original. Besides the empire of Menangcaboo, which comprised the greater part of Sumatra, this people possessed another empire not less powerful and more celebrated, that of Malacca, which, towards the end of the 14th century, under the brilliant reign of the Sultan Mohammed Shah, comprised nearly the whole coasts of the Malay peninsula, the islands of Lingen and Bintang, and the districts of Campar and Arou in Sumatra.

The *Battaks* or *Battas*, who are found in Sumatra, present perhaps the most extraordinary mixture of civilized and barbarous, or rather ferocious manners. For a long time they have written their language in a peculiar character; the greater part of them are able to read and write, and they possess an original literature, rich, though little known. They have a code of laws of high antiquity; but, from respect to these laws and to the institutions of their ancestors, they are still cannibals. This code condemns to be eaten alive—1. Those who are guilty of adultery; 2. Those who commit a theft under night; 3. Prisoners taken in important wars, that is to say, in the wars of one district against another; 4. Those of the same tribe who intermarry, a practice strictly forbidden; 5. Those who treacherously attack a village, a house, or a person. Whoever commits one of these crimes is judged and condemned by a competent tribunal; the prisoner is then tied to a post, cut in pieces, and eaten by the people. But men only partake of the feast; the eating of human flesh is forbidden to women. However revolting these executions may be, they are nevertheless the result of the calmest deliberations, and are seldom the effect of immediate or private vengeance, except perhaps in the case of prisoners of war. They were formerly also in the habit of eating their parents when these became too old to work; but this practice has long ceased. It is calculated that the number of people eaten in time of peace is from 60 to 100 yearly.

The *Achinese*, who possess the northern part of Sumatra, were, during the 16th and 17th centuries, the predominant people of Malaysia, being in alliance with almost all the commercial nations from Japan to Arabia, and comprising under their dominion considerable portions of Sumatra and Malaya. Although fallen from their ancient importance the Achinese are still much devoted to commerce and navigation.

The *Bima*, who occupy the greater part of Sumbawa, and are a somewhat polished people. The *Bellos* and the *Waikenos* divide between them the greater part of Timor.

The *Bugis* or *Wugis* (Boo-gheeze) are the most powerful people of Celebes, and the most commercial nation of Malaysia, forming the crews of almost all the trading prahus. They possess a native literature, and are considered as the original stock of both the Malays and the Javanese.

The *Macassars* or *Mangkassara* occupy the south-western peninsula of Celebes, and were at time the principal maritime people of Malaysia. They possess a native literature, but it is less than that of the Bugis.

The *Turajas* possess the middle part of Celebes, of which they seem to be the most ancient inhabitants. They are also called *Alfourous* by some voyagers; and are by some writers considered the original stock which has peopled Polynesia.

The *Bujous*, a numerous, warlike, and industrious people, possess a portion of the interior of neo. They are cannibals, and extremely ferocious.

The *Dayaks* of Borneo appear to be identical with the *Haraforas* and *Idaas* of the interior of great island. Their features, manners, customs, language, and religious faith present the most mate and incontestible relations with the physical and moral characteristics, not only of the people who inhabit the interior of the larger islands of the Philippines, the Moluccas, and Celebes, but of many of the natives of Polynesia. But very little is yet known concerning them, or of their and affinities.

The *Tagales* occupy the greater part of Luzon. They possess a peculiar alphabet; but their rature consists chiefly of translations of Spanish works.

The *Ilocos* inhabit the province of that name in the island of Luzon.

The *Bissayas* inhabit the islands of Samar, Leyte, Zebu, Calamines, Mindoro, Mashate, Panay, Ticao, Burias, and others of the Philippines.

The *Sooloos* possess the archipelago of that name; and are famed as pirates. The *Mindanaos* the principal people of the island of that name.

RELIGION.—Islam is the religion professed by the Javanese, Malays, Achine Bugis, Macassars, Sooloos, the people of the Moluccas, the Mindanaoese, and Illanos in the island of Mindanao, the greater part of the people of Samar and Leyte, and some tribes of Lampongs and Rejangs in Sumatra, with some of the Haraforos of Borneo and the Moluccas. Christianity is professed by a considerable number of people Catholicism, by the Spanish subjects in the Philippines, the people of Timor subject to the Portuguese, and several others in Sabrao, Flores, and others of the southern chain of islands: and Calvinism, by a great number of the people of the Moluccas particularly in Amboyna, and other Dutch settlements. Buddhism is professed by the Chinese, who are found in great numbers at Batavia and other parts of Malaysia, and by a portion of the people of Bali; Brahminism, by the greater part of the people of Bali and Madura, and by the Kelangs, a petty tribe in Java. The religion of the Battas in Sumatra acknowledges a sort of Trinity, a paradise, and a hell; and several of its dogmas, with some of the names of its subordinate deities, seem to be of Indian origin. Nothing is known of the religion of the Haraforos of Mindanao, but that they have temples and priests, and practise augury. The Rejangs of Sumatra who have no form of worship, believe in the metempsychosis. The religion of several of the independent tribes of Luzon, and others of the Philippines, consists in the adoration of good and evil spirits, and though they have no temples, altars, or idols, they have nevertheless priestesses, sacrifices, and sorcerers.

GOVERNMENT.—The forms of government exhibit every shade and variety, from that of isolated families living without laws or magistrates, to that extremity of despotism which characterizes the monarchies of Java. The most of the civilized inhabitants of Celebes, Sumatra, Borneo, and Mindanao, are governed by elective kings, who have very little authority. The government of Acheen, in Sumatra, fluctuates continually between anarchy and despotism; that of the Shushunan or emperor of Surcarta, and of the Sultan of Djocjocarta, was lately despotic, the power of these sovereigns being only limited by certain national customs; one of which is, that each village, with its district, forms a sort of body politic, governed by its chief, who is elected by the people. During the first century of Mahometanism in Java, the Mahalem priests formed a real hierarchy, which possessed the prerogative of choosing the sovereign; but of this they were deprived by the powerful family of Mataram, which rendered the throne hereditary. The throne of Sooloo is hereditary, but the Sultan's authority is limited by that of the datus or hereditary nobles, who form a council of state; by the Maharajah-lelah, who is a sort of censor, charged with watching the conduct of both the Sultan and the datus; and by the Orang-kaï-mallik, a sort of tribune of the people, whose duty it is to defend their rights. All the states of Celebes may be considered as aristocratic republics, where the sovereign power resides in an hereditary nobility, who choose, and may even depose the king, to whom they allow very little authority. The only foreign powers who have possessions in Malaysia are the Dutch, the Spaniards, and the Portuguese. The Dutch possess, or domineer over, the whole of Java, and the greater part of Sumatra, where they are continually extending their dominion over the native states. They possess also the Moluccа islands, and generally exercise a predominant influence over all the southern portion of the Archipelago. The Spaniards possess the island of Luzon, and several other portions of the Philippine group. The Portuguese possess only a portion of the island of Timor.

INDUSTRY.—With respect to industry, the Malaysians present the most marked

differences. While the negro races every where live in the forests among the ourang-outangs, in almost total ignorance of the arts and trades which are most indispensable to society, the numerous tribes of the brown race have generally reached a certain degree of civilization, and the most advanced among them have applied themselves with great success to agriculture, navigation, fishing, and even, in some places, to the working of mines. The people of Celebes, the Bugis, the Rejangs, the Javanese, the Illocos, the Camarinas, and the Malays, are excellent weavers. Several of them also shew great dexterity in the working of jewellery, gold and silver ornaments, and particularly in filagree, in the last of which the people of Manado, the Achinese, the Menangcaboos, the Rejangs, and the people of Padang, in Sumatra, particularly excel. The Malays of Borneo and the Javanese are acquainted with the art of cutting and polishing the diamond and other precious stones; and the latter work in wood with such distinguished skill, that they supply with furniture all the Europeans who reside throughout the Archipelago. A great commerce is carried on by the Malaysians in exchanging the products of their different islands, and of their industry. The Bugis, however, are the most commercial people of the Archipelago, and those of the State of Wajou monopolize the greater part of the foreign trade. The latter have colonies established in all the ports of Malaysia, from Acheen to Manila, and furnish almost all the crews of the Bugi proas which navigate the intervening seas. Nearly all the princes and chiefs of the maritime states of Malaysia and their principal officers trade on their own account, and in some places exclusively. Among the foreigners in Malaysia the Chinese carry on the most extensive trade. They are in the Archipelago what the Jews were in Europe during the middle ages, and still are in Asia, Africa, and eastern Europe. But, more active and more industrious than the Jews, besides trading both by wholesale and retail by sea and land, the Chinese also exercise the professions of gardeners, tailors, shoemakers, painters, distillers, and potters; they manufacture all the furnishings required by the civil and military establishments, levy the taxes, excise, and customs, work the mines, and coin the money. The insular position of the greater part of the Malaysians has made them expert and intrepid mariners; and they have carried to a high degree of perfection the construction of their various kinds of vessels. The Achinese and the Siaks of Sumatra, the Macassars and Bugis of Celebes, the Tagales of Luzon, and the natives of Mindanao, Sooloo, and Bali, excel all the other Malaysians in this art. The vessels of the Achinese, the Siaks, the Sooloos, and the Mindanaoese, are the largest, and are furnished with guns. The Tagales and others of the brown races of Luzon or Manila are almost universally employed as cannoneers or pilots, for both of which professions they are eminently qualified. At the same time, however, that Malaysia exhibits so active a commerce, it is infested by a great number of pirates or corsairs, the most notorious of whom are the Achinese and Siaks of Sumatra, the people of Lingen, Kali, and Tulituli, on the north-west coast of Celebes, the Tedongs a tribe of Dayaks, and the people of Sambas in Borneo, the people of Mindanao, the Illanos, and the Sooloos. But owing to the exertions of the British and Dutch cruizers, this public nuisance has been of late years much checked in those parts of Malaysia which are frequented by their subjects. Still the coasts of the Philippines are ravaged almost every year by the corsairs of Sooloo, Mindanao, and Borneo, in spite of the gun-boats which the Spanish Government maintains for the defence of their possessions. The slavery, which is recognised and sanctioned by law throughout Malaysia, with the exception of Java, the ferocity of some tribes, and the weakness and low condition of others, give occasion to the same kinds of abuse, violence, and atrocity, for which the African slave-trade has been so justly decried. All the nations which we have mentioned as the most addicted to piracy, are also the most actively engaged in this trade, which has received a great extension from the demands of the European, and particularly the Dutch, settlements for slave labour.

The principal articles of export are: nutmegs, cloves, cinnamon, pepper, coffee, rice, tin, gold, diamonds, pearls, ivory, edible birds'-nests, sandalwood, indigo, cotton, sugar, tobacco, camphor, turpentine, betel leaf, ambergris, coal, corn, horses, furs, lint and wool of the finest quality, whale-oil and balein, tortoise-shell, holothuries, birds of paradise, cocoas, ginger, sago, canes, rattans, areca nuts, bamboos, bread-fruit, wood of various kinds for building and cabinetmaking, and particularly, teak, coal, &c. The principal articles of import are: opium, salt, cloths, silks, porcelain, copper, oil, soap, wine, liqueurs, fire-arms and other weapons, gunpowder, and a great variety of European articles. The principal trading places are: Batavia, Samarang, Sourabaya, in Java; Rhio; Amboyna; Coupang, in Timor; Macassar, in Celebes; Manila, in Luzon; Borneo; and Acheen, in Sumatra.

For the purpose of topographical description, Malaysia may be divided into groups of islands, namely—1. *Sumatra*, and the smaller islands adjacent; 2. The chain of islands which extends east and west from the Strait of Sunda to New Gui including *Java*, *Madura*, *Bali*, *Lombok*, *Sumbawa*, *Comobo*, *Flores*, *Jindana* or *S delwood*, *Adenar*, *Solor*, *Lomblem*, *Pantar*, *Ombay*, *Timor*, *Semao*, *Rotte*, *Sara*, *C bi*, *Wetter*, *Serwatty*, *Babba*, *Timorlaut*, &c.; 3. The *Banda* and *Molucca Isles* 4. *Celebes* and the smaller adjacent islands; 5. *Borneo* and adjacent islands; 6. *Philippine Islands*.

1. SUMATRA stretches from N.W. to S.E. about 1050 miles, with an average breadth of 165, being vided into two almost equal parts by the equator, and extends from 5° 56 N., to 5° 56 S. lat. broadest in the south, and becomes gradually narrower towards the north. A chain of mount runs through its whole length, keeping nearest the west coast, forming in some places doubl treble ranges, which vary in height from 3000 to 5000 feet, while some of their peaks rise to more t double that height. Mount *Kissumba*, under the equator, is about 15,000 feet high, and M. *Ophir*, 13,000. Between the ranges are elevated plains, where the air is cool, and which, being c of wood, are the best inhabited parts of the island. These also contain many large and b lakes; but very little is known respecting the interior. The low land on the western coast is very row, scarcely any where exceeding 20 miles; but, in the southern part of the east coast, there broad plains, which are intersected by large rivers. This diversified surface occasions consider variety of climate; but the heat, even in the lowest parts of the coast land, are more moderate t in other tropical regions. At the most sultry hour in the afternoon the thermometer generally fluctu between 82° and 85°; and Mr. Marsden says that he never saw it higher than 86° in the shade, and at sunrise it is usually 74°. Inland, as the country ascends, the heat decreases so rapidly that, yond the first range of hills, the people require fires in the morning, and till the day advances; frost, snow, and hail are unknown in any part of the island. The hill country is exposed to a da fog, which rises every morning, and seldom dispersed till three hours after sunrise. The island is ject to the monsoons; the south-east monsoon or dry season, commencing in May and abating September; the north-east or wet monsoon, commencing in November and continuing till March ring which period the country is deluged with almost constant rain. There is also a daily cha of sea and land breezes, the latter of which is cold, chilly, and damp; exposure to it is dang to health, and sleeping in it proves almost certain death. Thunder and lightning are frequent and rific, especially at the change of the monsoons; and destructive earthquakes frequently occur. soil is generally a stiff, reddish clay, covered with a layer of black mould, from which there scri a perpetual growth of rank grass, brushwood, or timber, affording abundant cover for wild bea The most important article of produce is rice; next to it is the cocoa-nut, which also serves general article of food, while its oil is used for anointing the hair, and for lamps. There are large plantations of betel-nut trees and bamboos, sago-trees, and a great variety of other pal Sugar-cane, maize, Chili pepper, turmeric, ginger, coriander, and cummin seed are raised. Pep is a very important article; it seems to flourish in any kind of soil, and is a great article of tra Camphor, benzoin, cassia, and cotton are also produced, and form articles of export. Hemp is tensively cultivated, not for any useful purpose, but for producing *bang*, an intoxicating liquor, wh is smoked in pipes with tobacco. No country is more distinguished for the variety of fine fruits whi it produces spontaneously. Among these are the mangustin, pine-apple, orange, shaddock, lim lemons, bread-fruit, jack-fruit, mango, papaw, pomecranate, tamarind, and various nuts and aroc Owing to the equable temperature through out the year, there is an uninterrupted succession of s and flowers, which diffuse a pleasant fragrance, and many of which are used in medicine and the ful arts. Among these are the cast-oil plant, caoutchouc, ubar, a red wood resembling logwo its properties, and the upas or poison tree, whose deleterious qualities have been so much exagge The zoology is distinguished by some of the most remarkable animals. Elephants and tigers numerous and destructive. A small black bear is common; deer abound in great variety, and monkeys of all kinds are innumerable. There are also sloths, squirrels, skunkards, civet cats, porcupines, hedgehogs, armadillos, bats, alligators, hippopotamuses, guanas, camelions, flying tortoises, turtle, and buffaloes both wild and tame. The latter supply the people with milk, and beef, there being no bovine animals. The breed of horses is small, but well made and there are also sheep of a small breed, goats, and swine both wild and tame, otters, cats, rats, ar Frogs, toads, and reptiles of every kind abound in the swamps; snakes are common, but of very of them is the bite mortal. There is, however, the poisonous viper and the hooded snake; the constrictor is the largest, growing sometimes to a length of thirty feet, with proportionate thickness strength. Birds are extremely numerous, including peacocks, eagles, kites, vultures, crows, jacam kingfishers, the rhinoceros-bird, storks, snipes, coots, plovers, pigeons, quails, starlings, swal minas, parrots, parroquets, geese, ducks, teal, &c. The Sumatran pheasant is a magnificent b the plumage being, perhaps, the richest among all the animals of the feathered tribe. The island be said literally to swarm with insects, many of which are extremely annoying and destructive. the surrounding seas abound with fish. Sumatra is rich in minerals. Gold is chiefly found mountainous districts of the interior, in a pure metallic state. There are no silver mines; but copper mines contain a very rich ore, which resembles Japan copper in presenting the appearance a mixture of gold. In the country of Menangcaboo, in the centre of the island, iron ore is collect fined, and formed into metal, and steel is manufactured of a peculiar temper, and with a degree hardness which has never been equalled in Europe. Tin is one of the great mineral products abounds chiefly near Palembang on the east coast. Sulphur abounds; also yellow arsenic and saltpetre. There is also coal in various places; mineral and hot springs; edible birds'-nests; beeswax in great abundance, and an important article of trade; gumlac, and ivory.

The inhabitants are distinguished as Sumatrans and Malays, but the language of the latter is spoken every where along the coasts; it also prevails in the inland country of Menangcaboo, and is understood in almost every part of the island. The Malay character has been already described, see; and is every where the same. The Sumatran has many of the Malay vices, and a few negative virtues. He is mild, peaceable, and forbearing, but implacable in his resentment. He is temperate and abstemious both in meat and drink; his diet consists of vegetables, and water is his only drink. The people are continent, modest, and courteous, grave in deportment, seldom excited to laughter, and habitually patient. On the other hand they are litigious, indolent, and addicted to gambling. They have made no great progress in manufacturing industry and the useful arts; and their progress in science is equally limited. They have no notion of astronomy or geography; they do not even know that their country is an island; they are entirely destitute of history and chronology, memory of past events being only traditional. They are fond of music, but their instruments are chiefly of the noisy kind; they have no musical science, and only a few simple tunes. Their medical art consists in the application of a few simples, but chiefly in certain charms. They have no writ

laws, and no persons invested with legislative powers. Their disputes are settled according to ancient usage by the chiefs of districts, who are both civil and criminal judges. They purchase their wives, who become to all intents and purposes their slaves, and may be sold again. Land is so plentiful that it is scarcely considered as a subject of property. They have few capital punishments; murder is compensated by money, and adultery is punished by a fine, except among the Battas, whose ferocious customs we have already mentioned (p. 971).

Sumatra is partly independent, and partly under the dominion of the Dutch, who seem to be aiming at the possession of the whole island, as they have now extended their conquests along the whole eastern coast to the neighbourhood of Acheen. That territory, with the country of the Battas, and the possessions of other tribes among the mountains, are probably all that can now be considered independent. *Acheen* or *Achin* (*Atheens*) is a large city at the very north-western extremity of the island, about a league from the sea, consisting of about 8000 bamboo houses, situate in a thick forest of cocoa-nut trees, bamboos, ananas, and bananas, through which runs a river covered with vessels which are engaged in an active commerce. The authority of the sultan, once very extensive, appears now to be limited to the city and its immediate environs; the rest of his territory being in the possession of independent chiefs, and subject to continual anarchy. To the south of Acheen extends the country of the Battas, who form a sort of confederation, consisting of a great number of chiefs of districts; and farther south, along the east coast, are the kingdoms of *Siak*, *Jambi*, *Palembang*, and *Lampong*, all now subjected to the Dutch, whose dominion also extends along the greater part of the west coast; but no where are there any cities or towns of the least importance. The principal places on the west coast are at *Natal*, *Pontchang-catchil* or *Tappanouli*, *Padang*, *Fort Marlborough*, formerly the capital of the English settlements in Sumatra, and *Encoolen* which formerly contained 10,000 inhabitants, but has now much declined. *Menangcaboo*, near the centre of the island, formerly the capital of an extensive empire, is still regarded by the Moslem inhabitants as one of the principal sanctuaries of Islam.

Along the coasts of Sumatra is a number of considerable islands. The principal on the west coast, going northward, are *Engano*, *Mega*, *Sanding*, *South Pagai*, *North Pagai*, *Sai-berout*, *Batou* or *Mintao*, *Claps*, *Nias*, *Baniak*, *Babi* or *Hog Island*, and *Cocos*. On the east coast are *Banka*, *Billiton*, *Sinkep*, *Lingen*, *Bintang*, and a number of smaller islands, which form together the kingdom of Lingen, whose sultan is a vassal of Holland; *Carimon*, *Panjore*, *Rantau*, *Bankalis*, *Roupat*, and the *Arroa* islands, in the middle of the Strait of Malacca. Banka is a large but thinly peopled island, containing rich mines of tin, which is always found in alluvial deposits, seldom more than twenty-five feet from the surface. The tin of Banka is carried to almost every part of the world; but China and India are the principal markets. The island is inhabited by hill-people, sea-people, Malays, and Chinese, of the last of whom there are about 20,000, who perform all the labour of cultivating the pepper and working the mines. Billiton is noted for its iron mines. The islet of *Tanjong-pinang*, adjoining Bintang, was recently ceded by the sultan of Lingen to the Dutch for an annual pension of 60,000 florins. It contains the town of *Rhio* or *Riouw*, which the Dutch have declared a free port, and which is advantageously situate for becoming a great entrepot for the trade of Malaysia, and a rival to Sincapore.

To the north of Sumatra are the small islands of *Way*, *Rondo*, and others; and farther north, the two large groups of the *Nicobar* and *Andaman Islands*, which seem to form, the connecting links between the mountains of Sumatra and the chain of Anapectomiou, which terminates at Cape Negrais. The Nicobar islands are twelve in number; the principal of which are *Sambelong*, *Carnicobar*, and *Nancowry;* which are hilly and woody, and abound in cocoa-nuts. The inhabitants are of the brown Malaysian race, and are a peaceable and well-disposed people. The Danes have at different times formed settlements upon them, and claim possession of the group. The Andamans consist principally of two long islands, the larger of which extends about 140 miles N.-S. They are mountainous, woody, and in some places very picturesque. The inhabitants are negroes, who exist in the lowest condition of savage life. They go quite naked, live in hovels formed of twigs, and never cultivate the ground, but subsist chiefly on fish, which they spear with great dexterity. To the eastward of the Great Andaman is *Barren Island*, a noted volcano. When seen from the ocean this island presents a surface of bare rocks rising 1690 feet above the level of the sea; but the interior forms a great circular basin filled with sea water, and bordered all round with steep rocks, and in the midst rises a volcanic cone, which is very frequently in activity, but can only be seen through a cleft in the outermost rocks.

To the south-west of the most southern point of Sumatra, between 12° and 12° 14′ S. lat., and about 97° 4′ E. long. are situate the *Cocos* or *Keeling's Islands*, a low coral group of a circular form, surrounding a lagoon, and protected by a reef. The interior of the islands is in general not more than from 3 to 6 feet above the level of the sea; the soil is mainly composed of fine calcareous sand, with a small mixture of vegetable earth. The climate, though warm, is very salubrious; the range of the thermometer in the hottest season is from 78° to 86°; in the coldest, from 72° to 81°. A settlement has been formed upon them by two English gentlemen, who have introduced several Malay colonists, with various kinds of cultivated plants, cattle, goats, hogs, poultry, ducks, geese, and turkeys. Turtles are very numerous, and fish are found in great abundance.

2. JAVA, called by the natives *Tana (the land) Jawa* or *Misa (the island)*, is separated from Sumatra by the Strait of Sunda, and extends east and west about 665 miles, with a breadth varying from 56 to 136. It is situate between 105° 11′ and 114° 33′ east long. and 5° 38′ and 8° 46′ S. lat., and contains about 50,000 square miles. It is traversed through its length by a range of mountains, the middle part of which is the most elevated. The north coast is low and swampy, intersected by a great number of rivers, indented with fine bays, and contains many towns and villages. The south coast rises abruptly into high and rugged hills, against which the surf dashes so violently, that, with the exception of a few bays, it is almost inaccessible. The great mountain range contains the craters of at least thirty-eight volcanoes, but of these none are at present known to be in activity, though many emit smoke after heavy rain. In their neighbourhood are numerous mineral springs. The climate is various. Along the low northern coast it is hot and sultry; but inland, on the higher ground, the atmosphere becomes keen and pleasant. In some places among the hills, and even in many of the inland towns, it is often so cold as to render a fire desirable. At Welterreden the thermometer is generally at 86° in the dry season, or during the south-east monsoon, which extends from April till October; and from 83° to 90°, in the wet monsoon, from November till March. The monsoons, however, are not regular. Heavy rain seldom sets in till December, and the heaviest falls in February and March. There is a constant succession of land and sea breezes every day and night. Perhaps in no part of the world is vegetation so richly luxuriant, nor are the wants of man so easily supplied, without any trouble in cultivation. In the lowlands there are extensive rice fields. Around every cottage and village a variety of esculent fruits and vegetables may be gathered throughout the year. On the mountains are lofty trees suitable for masts, while forests of teak of the best quality supply the place of oak for building ships of all classes. The principal articles of produce exported are coffee, sugar, rice, indigo, and tin. The island contains a population of about 6,000,000, of whom 4,000,000 speak the Javanese language, 1,500,000 the Sunda, and half-a-million, the Malay, besides about 50,000 or 60,000 Chinese. The

Javanese are a nation of husbandmen, and their subsistence depends entirely on the produce of the soil. Only about one-third of the surface is supposed to be under cultivation; yet Java produces not only enough of corn for its own consumption, but is, besides, the granary of Malaysia. Within a few years, however, the cultivation of all its staple products has been very much increased; the Dutch Government has given full permission to cultivate spices; and the progress of the island has been altogether more remarkable than that of either Brazil or Cuba. About three-fourths of the island are immediately under the Dutch Government, and the remaining fourth is divided between the Sheshunan or emperor of Java, whose capital is Suracarta, and the sultan who resides at Djocjocarta. Both of these princes are the descendants of the emperors of Mataram, who acquired great power towards the end of the 15th century. In 1755 the Dutch divided the remaining portion of the empire between them. The religion of both of these States is Mahometan, which prevails over almost the whole country. The Dutch territory is divided into nineteen provinces styled residences, each governed by a European resident, and all under the control of the governor-general, who resides at Batavia. The land force consists of 11 battalions of infantry, a corps of pioneers, 2 battalions of artillery, a regiment of hussars, and a few lancers. There is also usually a considerable marine force; and a flotilla of cruisers, manned by native Javanese, is attached to each residence. Notwithstanding the heavy expense of this large establishment, Java, in ordinary years, remits a considerable revenue to the king of Holland.

Batavia, the capital of Java and of all the Dutch possessions in the East Indies, is situate near the west end of the north coast, in 6° 12′ S. lat., 106° 54′ E. long. It is built in marshy ground at the mouth of the river Jillwong, on the site of the ancient city of Jaccatra; several of its streets are traversed by canals, which are crossed by numerous bridges, and have their banks lined with trees in the Dutch style. The houses are old-fashioned, many of them being only hovels, tenanted by natives and Chinese, and the whole has a cheerless and even squalid appearance. The city covers a large space, but the houses are far apart, and the grounds attached to them are extensive. The population, in 1824, was only 53,861, of whom 7000 were Europeans; but it has since very considerably increased, and the city and its environs, within a circuit of 20 miles, are now estimated to contain about 300,000, of whom 30,000 are Chinese. All the Europeans reside in the country, at *Weltervreden*, *Cornelis*, and other places; sleeping in the town even for a single night, exposed to the noxious vapours, being almost certain to occasion fever. Batavia is the depot for the produce of all the Dutch possessions in the Archipelago; but its transport trade has much declined since the establishment of the free ports of Sincapore and Rhio. *Buitenzoorg*, the residence of the governor-general, is about four hours ride or 39 miles from Batavia. The sea opposite Batavia is covered with innumerable islets, which are clothed with luxuriant vegetation. *Bantam*, an ancient city west of Batavia, is now completely decayed; its bay, formerly a great rendezvous of European shipping, is choked up by coral reefs and islands of mud. The Dutch abandoned it in 1817, for the more elevated station of *Ceram* or *Sirang*, 7 miles inland. *Anjier*, still further west, on the coast of the Strait of Sunda, is the place where ships passing in the favourable monsoon generally call for supplies of water and provisions. It is situate on a large plain, adorned with extensive groves of cocoa-nut trees, and flanked by an amphitheatre of the most diversified and picturesque hills. A small fort, a bungalow, and a native village stand in close proximity near the shore. The other principal Dutch towns are *Cheribon*, *Samarang*, and *Sourabaya*, all on the north coast. Cheribon is a small town; but Samarang is a large city, built, like Batavia, in the old European style, with a flourishing trade, and about 38,000 inhabitants. Sourabaya is situate on the shore of a narrow strait which separates Java from Madura. It possesses the only perfectly secure harbour on the north coast, and the only one in which the shipping can be well defended by batteries on shore. The population is estimated at 50,000. Not far to the south-west, in the midst of the immense teak fore-ts which cover the western part of the province, are the ruins of the ancient city of Majiapahit, the capital of the Javanese in the most flourishing period of their empire; they extend for several miles along the banks of the river Kediri. *Suracarta*, the residence of the Emperor of Mataram, is a large city, built in the Javanese style, near the centre of the island, 270 miles S.S.E. of Batavia. It is, however, rather an assemblage of villages than a town; its population, in 1815, was estimated at 105,000. *Djocjocarta*, the residence of the Sultan, is also a large city, built in the same style, about 15 miles from the south coast, with a population estimated at 100,000. At *Brimbanan*, between the two cities, are several ruined temples; and at *Boro-bodo*, near the northern frontier of the territory of Djocjocarta, are the remains of a large Buddhist temple, which crown a small hill, and consist of seven stages or enclosures, decreasing in a pyramidal form to the top, which terminates with a dome. The walls contain about 400 niches, each with the statue of a person sitting cross-legged, and as large as life. It much resembles the temple of Buddha at Gaya, in India. There are many other ancient remains in the island; the most remarkable natural object, besides the volcanoes, is an extraordinary valley called by the natives *Guwo-upas* (Poisoned Valley), three miles from Balor, on the Djiang. It is about half a mile in circumference, of an oval form, 30 to 35 feet deep, and quite flat at the bottom, which is without vegetation, and strewed with large stones and skeletons of human beings, quadrupeds, and birds. It is generally about half filled with a noxious gas, which destroys life in a few minutes.

The island of *Madura*, separated from the north-eastern coast of Java by a narrow strait, forms one of the Dutch provinces or residences. It is 85 miles long, and from 20 to 30 broad. The people generally profess Hinduism, and are governed by three native princes, subject to the Dutch. *Bali* or *Balli*, separated from the east end of Java by a strait, is about 70 miles long, and about 50 broad at the east end, from which it diminishes almost to a point at the west, forming a sort of irregular triangle. It is rugged and mountainous, and inhabited by an idolatrous people, under eight chiefs, who are despotic and independent. Hinduism is the prevalent faith. *Lombok*, to the east of Bali, from which it is separated by a wide strait, is of a compact form, about 53 miles by 45, rugged and mountainous, but populous, fertile, and well cultivated. The people are Mahometans, very civilized, and carry on a considerable trade. The people of both Bali and Lombok devote almost their whole attention to agriculture, and export large quantities of rice. They also produce considerable quantities of fruits, tobacco, cocoa-nut oil, and coffee. Their cotton is of excellent quality, and is considered the best in the East Indies. *Sumbawa* (*Sumbara*, *Sumbhawa*) east of Lombok, is about 180 miles long, but of very irregular form, the northern side being indented by a large gulf which nearly divides the island. It produces sappan-wood, rice, horses, saltpetre, sulphur, wax, birds'-nests, tobacco. Near the N.E. end of the island is situate the town of *Bima*, remarkable for its excellent harbour, which is considered as one of the finest in the world. At the western extremity of a long peninsula on the north coast is the volcanic mountain of Tomboro, of which there was a terrible eruption in 1815. The sound of the explosions was heard over a range of 1500 miles, as far as Bencoolen on the one side, and Ternate on the other, and the shocks were felt at the distance of 1000 miles. The ashes were carried 200 or 300 miles, covering the sea with pumice and cinders, and making the day darker than night over a space of 80 miles. To the north of Sumbawa is a large group of low coral islands, named the *Laterwaters*, to the north-east of these is a similar group named the *Pathboys*; and to the westward the island of *Kambang*, forming the southern side of another large group of coral formation. Adjacent to the north-east coast of Sumbawa is the insulated volcanic mountain of *Gunong-Api*; and 800 miles farther east, in the Banda sea, is another insulated volcano, of the same name. *Manggary* (*Magarai*, *Comas*

considerable island to the eastward of Sumbawa, is dependent on the Sultan of Bima, who is himself a vassal of Holland.

Flores (*Floris, Ende, Œnde, Floresfica, Great Solor* or *Manggary*) is 220 miles in length E.W. by 50 in breadth. It is traversed by a range of volcanic mountains, and subject to earthquakes; it produces slaves, cocoa-nut oil, tortoise-shell, sappan-wood and wild cinnamon; but the interior has never been explored by Europeans. The western part belongs to the Sultan of Bima in Sumbawa; the rest appears to be divided among independent chiefs, some of whom used to be subject to the Portuguese government of Larentuca, situate at the eastern extremity of the island. A fine harbour on the south coast belongs to a colony of Bugis who refuse to acknowledge the Dutch supremacy. To the south-west of Flores is the large island of *Sumba, Jindana* or *Sandalwood*, which abounds with buffaloes, horses, poultry, and pheasants, and produces cotton and sandalwood; the latter, however, is exported only in small quantity, owing, it is supposed, to the superstition of the natives, who are unwilling to cut down the trees, as they believe them to be the abodes of the souls of their ancestors. The island is possessed by independent chieftains.

Timor is above 290 miles in length, by 50 or 60 in breadth, and is described by voyagers as a beautiful island, of an irregular and picturesque surface, having its limestone hills covered with trees and shrubs. It is divided into 63 petty states, all vassals to the Dutch or the Portuguese, who both have settlements in the island. *Dilli*, on the north-east coast, a small town, with 2000 inhabitants, is the residence of the Portuguese governor. *Coupang*, on a fine bay at the S.W. extremity of the island, is the chief Dutch settlement; which has been declared a free port, by way of rivalry with Port Raffles in Australia. The governor resides in the fort of Concordia. To the S.W. of Timor are the smaller islands of *Simao* or *Semao, Rotte, Savu, Benjoar* and others; to the north, *Wetter, Kisser, Cambi;* and to the west, between Timor and Flores, *Ombay, Pantar, Lomblem, Adenar*, and *Solor*.

3. The BANDA ISLANDS are a very scattered group to the eastward and north-eastward of Timor, and are distinguished by the German geographers into three divisions:—the Group of Banda; the south-west chain; and the south-east chain. The first of these divisions is composed of ten islets, all more or less unhealthy, and subject to frequent and violent earthquakes. Of these, *Banda, Lonthoir*, and *Pulo-Aij*, are the most important, inasmuch, as they have been exclusively reserved for the culture of the nutmeg. The average produce of these islands has been estimated at 500,000 lbs. of nutmegs, and 150,000 lbs. of mace, which is the innermost covering of the nut. Banda contains the small town of *Nassau*, the residence of the Dutch governor; the forts *Belgica* and *Nassau*, on this island, and *Hollandia* on Lonthoir, defend the fine bay formed by these two islets and the insulated volcanic mountain of *Gunong-Api*, the third of the name which we have had occasion to mention. The south-west chain consists of several islands subject to the Dutch. The principal are *Letti, Moa, Lackar, Sermatta* or *Serawathy, Kisser*, and *Wetter*; the last two of which have been already mentioned as being adjacent to Timor. The south-east chain consists of a number of larger islands, as *Timorlaut, Larat, Tenember*, the *Great Key* and the *Little Key*; but the only one of them which is of any importance is the Great Key, which contains the town of *Ely*, the seat of a great trade carried on by the Bugis.

The MOLUCCA ISLANDS are situate to the north of the sea of Banda, and include the large islands of *Ceram, Bouro, Gilolo*, and many smaller islets. By some geographers the Banda Islands are also classed under this name. *Ceram*, 220 miles in length, by 50 in breadth, is traversed by a range of mountains, and is very populous. It is divided among several chiefs, all of whom are vassals of Holland. *Bouro* lies to the westward of Ceram, and is 120 miles in length, by 60 in breadth. *Cajeli*, at the east end, is the residence of a Dutch governor; but the chiefs of the island are independent. To the eastward of Ceram is the small island of *Goram*, only remarkable as the most easterly point which the religion of Mahomet has reached. To the south-west of Ceram, and close to the coast, is the celebrated island of *Amboyna*, the principal seat of the cultivation of cloves. It is 32 miles in length, by about 10 in breadth, and contains an area of 434 square miles, with a population of 45,000. Its surface is mountainous, and is divided by a long gulf or bay into two unequal peninsulas. The soil is a rich red loam; the climate is healthy; the average heat of the year is 82° of Fahrenheit; the lowest temperature, 72°. The Dutch governor resides at *Fort Victoria*, on the south-east side of the great bay; and immediately adjoining is the town of *Amboyna*, which contains about 7000 inhabitants. The Molucca Islands, properly so called, consist of *Gilolo, Ternate, Tidor, Motir* or *Matchan, Batchian, Grand Oby, Mysol, Popo, Mortay, Salibaba, Mengis*, and many others. The largest of them is Gilolo, which is 220 miles in length, but of very irregular breadth, consisting in fact of four peninsulas, which meet near the centre of the island. *Ternate*, a small island on the west side of Gilolo, contains a lofty volcanic peak, whose recent eruptions have almost destroyed the surface of the island. It was previously celebrated for the production of cloves, nutmegs, and mace, and was considered of great importance by the Dutch as a commercial and military station. *Tidor*, to the south of Ternate, and smaller, is a still more populous island than the latter was, and also contains a lofty peak.

4. CELEBES, one of the principal islands of Malaysia, extends 769 miles in length between its north-eastern and south-western extremities, but is very narrow, and of the most irregular form, consisting, like Gilolo, of four peninsulas, which are separated by three large gulfs. Its area is computed at 75,000 square miles. It abounds in extensive grassy plains, which afford cover and abundant pasture for deer, wild hogs, and a variety of other game. Rice, maize, and cassava, are the principal agricultural products. The middle part of the island is said to be inhabited by Haraforos; but the greater part of the population are of the brown race, divided into a great number of tribes or nations, of whom the Bugis are the most considerable. Most of the native states are dependent on the Dutch, who have their principal station at *Fort Rotterdam* and the small town of *Vlardingen*, both erected on the site of the ancient city of Macassar, which has a fine and secure roadstead, near the south-west extremity of the island. The principal native state is the kingdom of *Bony* or *Boni*, on the east coast of the south-western peninsula; its actual capital is *Bayoa*, a town of 8000 inhabitants. The middle part of the island is occupied by the kingdom of *Wadjo*, inhabited by Bugis, and governed by an elective king or chief, assisted by a council of forty chiefs, who decide on all questions of peace and war. Adjoining Celebes is a number of islands, some of which are of considerable extent, as *Sangir* and *Siao*, off the north-east point; *Zula-mangola, Zula-bani, Bangay, Bataling, Peling, Bankel, Waxway, Waiwangy, Boutong, Panjasang*, and *Toukang-busi Isles*, off the east coast; *Cambyna, Salayer, Tiger Isles, Schiedam Isles, Crompa, Kalatoa, Madwa*, off the south coast.

5. BORNEO, called by the Malays *Pulo Klemantan*, is a very large island, of a compact form, about 750 miles in length, by 350 in breadth, and contains an area of 260,000 square miles. It lies immediately under the equator, extending from 4° 10′ S. to 7° N. lat. The interior of this great island is still a complete blank in geography, and even of the coasts but little is known. The geological formation of the mountains is generally granitic. The island is said to be rich in minerals, and produces gold, tin, diamonds, camphor, spices, and other valuable articles of commerce. The several coasts are inhabited by people of different races, totally unconnected, governed by their own laws, and having their own peculiar customs: the west coast, by Malays and Chinese; the north-west, by the mixed descendants of the Moors of Western India; the north, by Cochin-Chinese; the north-east by Sooloos; and the east and south, by Bugis. There are, besides, three distinct tribes, who live in prahus, along

the coasts; the Lanuns, from Mindanao; and the Orang-badju, and the Orang-tidong, of unknown origin. The interior and part of the north-west coast are inhabited by *Dayaks* or *Dyaks*, a savage people, who are scattered in small tribes over the island, and are believed to be its aboriginal inhabitants. They are of the brown Malaysian race, and of mild and prepossessing manners; but, as they have suffered greatly from the Malays, they now generally avoid strangers. Some parts of the interior are also inhabited by people of the negro race, named *Dayers* or *Igolotes*. Borneo is divided into a great number of petty states, most of which are independent; but some of those on the west coast are subject to the Dutch, and those of the north-east, to the Sultan of Soloo. The principal of the independent states is the *Kingdom of Borneo* (Bourni), on the north-west coast. *Borneo*, the capital, is situate on a considerable river, and intersected by canals. It contains about 10,000 inhabitants, many of whom constantly live in boats. The *Kingdom of Passir*, on the east coast, is possessed by a Malay Sultan, who resides at *Cotti* or *Gooty*. His subjects, as well as those of Borneo, are notorious pirates. The Dutch have several settlements, divided into two residences or provinces. The Residence of the west coast comprises—1. The States of the Sultan of Sambas, whose capital is *Sambas*, a small town with a Dutch fort; 2. The country of Mumpawa, which extends very far inland, and contains the rich gold mines of Mandor or Montrado, which are worked by Chinese; 3. The kingdom of Pontianak, whose capital of the same name is a small town, with a fort, and 3000 inhabitants; 4. The countries of Landak and Sandou, in the interior to the eastward of the preceding; Landak is renowned in the East for its rich diamond mines, where in 1815 was found a diamond weighing 367 carats uncut, and which Balbi considers to be the third largest in the world; 5. The country of Simpang; 6. The State of Malan, or the ancient empire of Succadana, the throne of which was long occupied by princes of Javanese origin, vassals of the king of Bantam; 7. The territory of Kandawagan. The Residence of the south and east coasts, or of Banjermassing, comprises the countries of Komaay, Pambuan, Mandawa, Great Dyak, the Peninsula of Tanah Laut, and several other adjoining districts in the interior. *Banjermassing*, a town of 7000 inhabitants, with an active trade, situate on a river of the same name, is the capital. The smaller islands geographically attached to Borneo, are the *Natunas, Anambas, Tambelan, St. Esprit, St. Barbe, Daton, Caramata, Kumpal*, on the west coast; *Lavrot, Moreu, Pulo Laut, Triangle-rocks, Little Paternosters, Donderkom, Bemige, Maratabou*, on the east coast; *Balambangan, Bangwy, Malawali, Cagayan-sooloo*, on the north-east coast; and the *Soolo Archipelago*, extending between Borneo and Mindanao. This Archipelago comprises a great number of islands, of which about 60 are inhabited; they are subdivided into three groups, but form only one kingdom, under the Sultan of Sooloo, whose subjects are devoted to piracy. His capital is *Bevan* or *Soung*, a town of 6000 inhabitants, in the island of Sooloo.

6. THE PHILIPPINE ISLANDS are the most northerly group of Malaysia, extending between 5° and 20° N. lat. and 116° and 120° E. long. The group consists of about a thousand islands, of which nine are remarkable for their extent, namely, *Luzon* or *Luçon*, *Samar*, *Leyte*, *Mindanao*, *Zebu*, *Negros*, *Panay*, *Mindoro*, and *Paluwan*. They are all mountainous and volcanic; and their surface is diversified not only by numberless torrents and straits, but also by marshes, mossy grounds, and lakes; there is but little regular firm land. During droughts the miry and spongy soil is full of chinks; earthquakes occasion dreadful ravages; the islands are also frequently visited by violent hurricanes and drenching rains; yet it is to the great humidity that the Philippines owe their fertility. They contain wide forests of stupendous trees, and the greatest part of the birds, beasts, plants, and fruits for which Asia is remarkable are there found of a superior class, besides many productions not met with elsewhere. The sea, rivers, and lakes abound with fish, and the earth teems with valuable minerals. The climate is generally very uniform, and usually mild, but is nevertheless exposed to great and sudden change. The trees never lose their leaves, and the ground always wears a green and smiling aspect. The plants and flowers are beautiful and aromatic; the fruits are nutritive and of exquisite taste; the air is salubrious, and the natives live to a good old age, though foreigners, from the effects of too copious a perspiration, are not generally so healthy. When the Spaniards first arrived at the Philippines, they found scarcely any other food than rice; now, wheat and other grains are abundant, as well as most of the other productions of the Old World, as coffee, sugar, cocoa, hemp, tobacco, cotton, indigo. The same increase has extended to horses, horned cattle, hogs, and deer; sheep alone have degenerated, owing to the humidity of the climate. The prevalent diseases are intermittent fevers; contagious distempers, except the small-pox, are unknown; cutaneous diseases, however, are very common, and this the natives ascribe to the great use of fish. The population is numerous, but only a few hundreds are Europeans; the remainder consisting of Creole Spaniards, Mestizos, Malays, and aborigines. The latter are of both the brown and the negro Malaysian races, the last mostly occupying the secluded portions of the uplands, to which they seem to have receded as the lighter coloured people advanced. Very few of them have ever been domesticated by the Spaniards; and generally it has been found impossible to civilize them; it is observed that their numbers have greatly diminished, owing to the inclemency of the weather, diseases, particularly the small-pox, and their precarious supply of food. The brown races possess all the coasts and low country, some as subjects of Spain, and some belonging to independent princes. The Philippines were discovered in 1521 by Magellan, who lost his life in a skirmish with the natives of Leyte. They were colonized by the Spaniards in 1570; but the total number of settlers of that nation is estimated at no more than 4000, of whom 3000 are in the city of Manila.

Luzon, the largest of the Philippines, is about 350 miles in length, but of a very irregular form and breadth, and comprises an area nearly equal to that of all the other islands together. The portion subjected to the Spaniards is divided into sixteen alcadies or provinces; the independent portion, which comprises the east coast and almost the whole of the interior, is parcelled out among a number of petty chiefs, some of whose subjects are very ferocious and entirely savage. *Manila*, the capital of the Spanish settlements, is situate on the south-west coast, not far from the mouth of the river Passig at the head of a large and beautiful bay. It is a well built town, and is divided by the river into two parts, which communicate by a fine stone bridge. The palace of the captain-general, the cathedral, and two of the principal convents, are the finest buildings; several of the churches are richly decorated. There is a theatre, a college, several schools, and a patriotic society, founded in 1781. There are several manufactures and other works, and the commerce of the city is very important. The city proper is said to contain only 10,000 inhabitants; but, including all the suburbs, the amount of the population has been estimated from 160,000 to 175,000; but there are no means of ascertaining it. The only other town of any importance is *Cavite*, on the Bay of Manila, with about 6000 inhabitants, containing fine ship-building slips, an arsenal, large magazines, and a fine harbour, which also serves for the port of Manila during six months of the year. The Spaniards also possess Samar; the west coast of Leyte; Zebu and Bohol; the coasts of Negros and Panay; the small group of the Calamines; a small part of Mindoro; the small group of the Babuyanes to the north of Luzon; Grafton, one of the Bashee islands; and three small isolated districts in Mindanao, including the town of *Samboangan*, at the south-western extremity of the island, a small place, with 1000 inhabitants, and a fort. The other two districts are *Misamis*, near the middle of the north coast, and *Caraga*, on the east coast. All the other islands and parts of islands are independent.

The *Kingdom of Mindanao* or *Magindanao*, comprises nearly the whole of the east coast, and the greater part of the best portion of the island, with the small group of *Mangis* to the south-east. Se-

Iaugan is the residence of the Sultan; the city of *Magindanao*, which is separated from it by a river, is almost wholly abandoned. The people of this kingdom are formidable corsairs, as are also the Illanos, whose territory extends to the westward of that of Mindanao, and who form a confederation of 16 sultans and 17 chiefs. The independent part of the west coast is occupied by savage tribes.

Palawan or *Paragoa*, one of the largest of the Philippines, is about 280 miles in length, but seems no where to exceed 35 in breadth; it is, however, very little known. The interior is occupied by independent tribes; a great part of the coasts is subject to the Sultan of Sooloo; and the Spaniards possess only the small district of Tay-tay, on the north-east coast.

The most northerly islands of Malaysia are the *Bashee Islands*, situate about midway in the channel beween Luzon and Formosa. The group consists of several small islands, ruled by independent chiefs, except that of *Grafton*, where the Spaniards have a small establishment. The other larger islands are *Bayal* or *Orange*, *Batan* or *Monmouth*, and *Bashee* or *Goat Island*.

Having thus gone over all the islands, we shall conclude our account of Malaysia with a list of the principal seas, bays, gulfs, straits, and capes.

SEAS, &c.—The *Strait of Malacca*, between Malaya and Sumatra; the *Strait of Sunda*, between Sumatra and Java; the *Strait of Bali*, between Java and Bali; the *Java Sea*, between Java and Borneo; *Banca Strait*, between Banca and Sumatra; *Gaspar Strait* and *Clement's Strait*, between Banca and Billiton; the *Caramata Passage* or *Billiton Strait*, between Billiton and Borneo; the *Strait of Lombok*, between Bali and Lombok; *Allass Strait*, between Lombok and Sumbawa; *Sapy Strait*, between Sumbawa and Comobo; *Mandgerai Strait*, between Comobo and Flores; *Timor Strait*, between Timor and Ombay; *Flores Sea*, to the north of Flores and Timor; the *Banda Sea*, between Timor and Ceram; the *Molucca Passage*, between Gilolo and Celebes; *Tomini Gulf*, *Tolo Gulf*, and *Bony Gulf*, on the east side of Celebes; *Macassar Strait*, between Celebes and Borneo; *Celebes Sea*, between Celebes and the Philippines; the *Sooloo* or *Mindoro Sea*, between the Sooloo Archipelago and Palawan.

CAPES.—*Acheen Head*, the northern extremity of Sumatra; *Java Head*, the western extremity of Java; *Cape Bajeado* and *Cape Engano*, the two northern extremities of Luzon; *Cape Espiritu Santo*, the north-eastern extremity of Samar; *Cape St. Augustine*, the most easterly point of Mindanao.

II. AUSTRALASIA.

THE astronomical position of this central region of Oceania is between 1° N. and 55° S. lat., and 112° and 180° E. long. It is bounded on the west by the Indian Ocean; on the north-west, north, and north-east, by an imaginary line drawn between New Holland and New Guinea on the one side, and Timor, Timorlaut, Ceram, Mysol, Gilolo, the Pelew Islands, Carolinas, Feejee Islands, &c., on the other; on the east, by the Southern Pacific Ocean; and on the south, by the Antarctic Ocean. Australasia includes *Australia* or *New Holland*; *Van Dieman's Land*; *New Zealand*; *Papuasia* or *New Guinea*; *New Britain*, *New Ireland*, *Solomon Islands*, *New Caledonia*, *New Hebrides*, *Queen Charlotte's Islands*; *Solomon's Archipelago*; *New Hanover*: *Admiralty Isles*; besides many smaller islands scattered over the intervening seas.

AUSTRALIA.

ASTRONOMICAL POSITION AND DIMENSIONS. — Between 10° and 40° S. lat., and 112° and 154° E. long. Greatest length from east to west, 2400 miles; greatest breadth, from north to south, 1970; superficial area, 3,000,000 square English miles; length of coast-line, about 8000 miles.

GENERAL ASPECT. — Australia presents a very compact mass of land, with few gulfs or bays penetrating to any considerable distance inland, and, so far as has yet been discovered, no large navigable rivers. With the exception, however, of the south-eastern corner, extending from Spencer's Gulf on the south coast, to Moreton Bay on the east, and a small district in the south-west, the interior, beyond what is visible from the shore, is quite unknown. The east coast, throughout its whole extent from Bass's Strait to Torres's Strait, is bounded by ridges of steep,.and in some places, lofty mountains, at various distances from the sea, approaching in some parts within 30 miles of the coast, while in others they recede to double and treble that distance, and leave between them and the ocean a belt of cultivable land, intersected by short rivers, and terminating seaward with a high and sometimes precipitous coast. The southern coast, on the contrary, from Cape Leeuwin to Spencer's Gulf, is generally low and sandy, with only a few scattered eminences, and scarcely any where presents mountains in the interior. The eastern coast of the Gulf of Carpentaria is no where higher than a ship's mast-head; the south and west coasts are more hilly and broken. From Cape Wessel to Cambridge Gulf, the coast of Arnheim's land is flat and wooded, and interspersed with low hills, which present generally flat summits; but, from Cambridge Gulf to Cape Cuvier, the north-west coast exhibits irregular ranges of detached rocky hills composed of sandstone, which rise abruptly from extensive plains of low and level land, while in some places the adjoining sea is studded with numerous sandstone islands. Farther south the coast seems to resemble that of New South Wales, and to be lined at a short distance by ranges of mountains.

SEAS, BAYS, GULFS, STRAITS.—The *Gulf of Carpentaria*, a large expanse of sea on the north coast, 650 miles in length, north and south, by 400 in width. *Shelburne Bay*, *Temple Bay*, *Princess Charlotte Bay*, *Bathurst Bay*, *Trinity Bay*, *Rockingham Bay*, *Halifax Bay*, *Cleveland Bay*, *Edgecumbe Bay*, *Repulse Bay*, *Broad Sound*, *Shoalwater Bay*, *Keppel Bay*, *Port Curtis*, *Bustard Bay*, *Hervey Bay*, *Wide Bay*, *Moreton Bay*, *Tryal Bay*, *Port Macquarrie*, *Port Stephen's*, *Port Hunter*, *Broken Bay*, *Port Jackson*, *Botany Bay*, *Lake Illawarra*, *Shoalhaven*, *Jervis Bay*, *Sussex Haven*, *Bateman Bay*, *Twofold Bay*, *Corner Inlet*, on the east and south-east coast, between Cape York and Wilson's Promontory. *Bass's Strait*, a large open channel, 140 miles wide, between Australia and Van Dieman's Land, first discovered by Mr. Bass, a surgeon of the navy, in an open boat in 1798; *Western Port*, *Port Phillip*, *Portland Bay*, *Discovery Bay*, *Encounter Bay*, *Gulf of St. Vincent*, *Investigator Strait*, *Spencer's Gulf*, *Coffin Bay*, *Anxious Bay*, *Streaky Bay*, *Smoky Bay*, *Fowler's Bay*, the *Great Australian Bight*, *Esperance Bay*, *Doubtful Island Bay*, *King George's Sound*, *Torbay*, *Wilson Inlet*, *Parry Inlet*, *Flinders' Bay*, on the south coast. *Baie du Geographe*, *Cockburn Sound*, *Gage Road*, *Jurieu Bay*, *Geelvink Channel*, *Gantheaume Bay*, *Shark Bay*, *Geographe Channel*, *Exmouth Gulf*, on the west coast. *Dessait Bay*, *Lagrange Bay*, *Roebuck Bay*, *Sunday Strait* and *Cygnet Bay*, *Collier Bay*, *Camden Sound*, *Port George IV.*, *Prince Regent River*, *Brunswick Bay*, *York Sound*, *Prince Frederick's Harbour*, *Montague Sound*, *Admiralty Sound*, *Vansittart Bay*, *Cambridge Gulf*, and *Anson's Bay*, on the north-west coast. *Van Dieman's Gulf*, formed by Melville and Bathurst islands and Coburg peninsula, and opening to the sea by *Clarence Strait* and *Dundas Strait*. *Port Essington*, *Bowen Strait*, *Mountmorris Bay*, *Junction Bay*, *Castlereagh Bay*, *Brown Strait*, and *Arnheim Bay*, on the north coast.

CAPES.—On the east coast:—*Cape York*, the north-eastern point of the continent, from which in order proceeding southward we find *Orford Ness*, *Cape Grenville*, *Fair Cape*, *Weymouth Cape*, *Cape Direction*, *Cape Melville*, *Cape Flattery*, *Cape Bedford*, *Cape Tribulation*, *Cape Grafton*, *Double Point*, *Mount Hinchinbrook*, *Cape Cleveland*, *Cape Bowling-green*, *Cape Upstart*, *Cape Hillsborough*, *Sose Point*, *Cape Palmerston*, *Cape Townshend*, *Cape Capricorn*, *Break-Sea-Spit*, and *Sandy Cape*, two

Moreton, Cape Byron, Smoky Point, Cape Hawke, Sugar-loaf Point, Cape Solander and *Cape Banks*, the two points which form the entrance to Botany Bay; *St. George's Head* at *Sussex Haven; Mount Dromedary, Green Cape, Cape Howe, Ram Head, Point Hicks*, and *Wilson's Promontory*, a rocky mass which forms the most southerly point of Australia, at Bass's Strait. On the south coast, going westward:—*Cape Liptrap; Cape Paterson; Cape Wallomai* and *Point Grant*, at the entrance of Western Port; *Cape Schank; Point Nepean* and *Point Lonsdale*, at the entrance of Port Phillip; *Flat-top Point, Cape Patton, Cape Otway, Bold Head, Cape Sir William Grant, Cape Nelson, Cape Bridgewater, Cape Northumberland, Cape Buffon, Cape Lannes, Cape Bernouilli, Cape Morad; Cape Jervis*, at the south-eastern side of the gulf of St. Vincent; *Cape Spencer* and *Cape Catastrophe*, at the opposite sides of Spencer's Gulf; *Cape Willoughby, Cape Linois*, and *Cape Borda*, on Kangaroo Island; *Cape Radstock, Point Brown, Point Bell, Point Fowler, Cape Adieu, Cape Pasley, Cape Knobb, Point Nuyts, Cape Chatham, Point D'Entrecasteaux, Cape Beaufort*, and *Cape Leeuwin*. On the west and north coast, going northward:—*Point Naturaliste, Cape Leschenault, Cape Ronsan, Cape Cuvier, Cape Farquhar, Northwest Cape, Point Guntheaume, Cape Leveque, Cape Bougainville, Cape Londonderry, Cape Van Dieman*, on Melville Island, and *Cape Arnheim*, at the entrance of the Gulf of Carpentaria.

ISLANDS.—Along the north-east coast there is a very great number of small islands, whose names we need not specify. The same coast is lined by a long chain of coral rocks named the *Barrier Reef*, in the inside of which there is a navigable but intricate channel. Proceeding southwards the first islands worthy of notice are *Moreton Island* and *Stradbroke Island*, which form the eastern side of Glasshouse and Moreton Bays; the *Solitary Isles*, in 30° S. lat.; *Black-head Isle*, to the north of Port Stephen's; *Montague Island*, 36° 20′ S., *Seal Islands, Hogan Islands, Moncur Islands, Rodondo*, and *Glennie's Islands*, to the east, south, and west of Wilson's Promontory; *Phillip Island* and *French Island*, in Western Port; *Lady Julia Percy's*, and *Lawrence Islands*, in Portland Bay; *Kangaroo Island*, off the Gulf of St. Vincent, about 100 miles in length, and from 25 to 30 in breadth, separated from the mainland by Investigator Strait and Back-stairs Passage, abounding with salt and game for the sportsman; *Althorp Island*, S.E. of Cape Spencer; *Thistle's Island, William's Island, Reevesby's Island*, in Spencer's Gulf; *Boston Island*, in Port Lincoln; *Investigator's, Flinders'*, and *Waldegrave's Islands, Nuyt's Archipelago*, &c. on S.W. coast of South Australia; *Archipelago of the Recherche*, on the south coast of Nuyt's Land; *Rottennest Island*, off the Swan River, in Western Australia; *Houtman's Abrolhos*, a cluster of rocks and shoals, separated from the mainland by Geelvink Channel, between 28° and 29° S. lat.; *Dirk Hartog's Island, Dorre Island, Bernier Island, Faure Island*, and *Peron's Peninsula*, off and in Shark's Bay; *Dampier's Archipelago, Howley Shoals, Lively Coral Reef, Scott's Reef, Cartier Island*, and many others, on the north-west coast; *Bathurst Island, Melville Island, Cobourg Peninsula, Croker's Island*, and *Wessel Island*, on the northern coast of Arnheim's Land, or North Australia; *Groote Eylandt* (*i.e.* Big Island), *Rickerton Island, Sir Edward Pelew's Islands*, and *Wellesley Islands*, in the gulf of Carpentaria.

CLIMATE.—As nearly a third of the area of Australia is situate to the north of the tropic of Capricorn, the climate of this portion necessarily partakes of the heat of the torrid zone; but little concerning it is known, since only the coasts have yet been explored. On the north coast, however, a wind from the south raises the temperature with extreme suddenness, and as the same effect is produced by a north wind in the interior of New South Wales, it may be inferred that the wind, in both cases, passes over a highly-heated country, probably over a range of sandy deserts. The other two-thirds of the area lie within the southern temperate zone, and towards the south-east and south the climate is really temperate and delightful; it nevertheless experiences sudden changes, there being instances of the thermometer having varied 25° in fifty minutes, in consequence of a sudden change of the wind. The north-west winds produce so great a degree of heat as to become scorching, and the thermometer then rises suddenly from 80° to 110°. The south-east winds, on the contrary, are very often cold and piercing, especially when there is a sudden change from a hot north-west wind. But in spite of such occurrences, which are to be considered as exceptions, the climate is generally delightful; and the evenings and mornings are as pleasant as in southern Italy. On the lower parts of the coast the thermometer ranges in summer from 36° to 106°; and in winter, from 27° to 98°. The average temperature of the spring months is about 65°; of summer, 72°; of autumn, 66°; and of winter, 55°. At Sydney the thermometer rarely falls below 40° in winter; but at Paramatta, only 15 miles distant, it is frequently so low as 27°; and, in the neighbourhood of the Australian Alps, where the snow is perpetual, the wind from the mountains produces occasionally a sort of snow storm in the low country. As the ground rises the temperature decreases: the winter at Bathurst, west of Sydney, and 1970 feet above the level of the sea, is much colder than on the sea shore, and warm winter clothing has been found necessary even in April, which corresponds with our October. Heavy snow storms also sometimes occur in these elevated regions; and though the snow does not lie in the valleys, yet the elevated flats and downs remain covered for many days; frost also is there frequent, and very intense. The mean annual temperature of these mountain terraces is nearly equal to that of England, but the extremes are much greater. The low interior is always hot, whether dry or flooded. In South Australia, the thermometer has been known to rise in summer to 101° in the shade; in a tent exposed to the sun it was observed one day at 113°; the next day, 117°; the third, 115°; but, on the fourth, only 61°. The climate of that province is indeed very changeable, "ten times more so than that of England," according to one writer; and, though generally salubrious, it is found to be better suited for invalids and persons who have passed the meridian of life, than for young people in robust health and of strong constitutions. It is very dry, though much less

so than in New South Wales; rain frequently falls in South Australia, whereas recently in New South Wales there was a continued drought of eighteen months.

The prevailing winds in summer are from north-east to south-east, and in winter, from north-west to south-west; the atmosphere is generally clear and dry; but dews are frequent and heavy, and sometimes assume the form of a drizzling rain; while in summer the hot winds, which however are of short duration, seldom continuing more than two days at a time, and often less than six hours, are the sure harbingers of a squall or thunder storm which fills the air with a volume of impalpable sand, but clears away every thing noxious, and restores afresh the usual serenity. During summer also a regular sea breeze sets in daily, and much refreshes the inhabitants of the coasts, where, besides, the hot winds are not felt so severely as at some distance in the interior. The most remarkable peculiarity, however, of the Australian climate, is its general dryness, although a great quantity of rain usually falls throughout the year; but it falls in torrents, and is not regularly distributed in showers. The rain, when it does fall, is generally confined to certain months, which vary on the opposite sides of the mountains; floods on the coast occurring simultaneously with dry weather in the interior, while, on the contrary, the latter has its rains when the coast is dry. May is usually the rainy season on the coast; between September and February the rain falls in the interior. There are, however, periods when no rain falls for one, two, or even three years together, and unmitigated drought prevails. These periodical droughts seem to occur at regular intervals of about twelve years; in close succession follows a period of floods or heavy rains, which are at first continuous and as general as the preceding droughts, but decrease with every succeeding year till the period of drought returns. It is only in the years that are intermediate between these extremes that a regular annual succession of seasons is observed; and even then, the seasons are more distinctly marked in the high than in the low country. The seasons, of course, occur at the periods of the year opposite to those of Europe, January being the middle of summer, July, of winter. Summer extends from November till March; and spring and autumn are brief but well defined. The spring months are September, October, and November; the summer, December, January, February; autumn, March, April, May; winter, June, July, and August.

The climate, however, is proverbial for salubrity; endemic diseases are unknown, except a species of ophthalmia, which occurs in October and November, and is occasioned by the prevailing winds of that season. Of a community of 1200 persons only five or six have been known to be sick at one time, and at some of the military stations seven years have elapsed without a soldier dying. Old people, on their arrival from Europe have suddenly found themselves restored to much of the hilarity of youth, and several persons have been known upwards of 100 years of age. Dysentery is the most prevalent disease; but deaths from disease are exceedingly rare, and all disorders yield with facility to the simplest remedies. The diseases, in short, which do occur, are represented as being, in three cases out of four, the result of moral causes. Excess in the use of animal food and of ardent spirits, is in Australia, as every where else, the great promoter of disease. Temperance in eating and drinking will be found by the emigrant the most effectual means for the preservation of health; while excessive indulgence, especially in the latter, is more likely than even at home to undermine his constitution, and to blast his prospects with still more fearful and fatal rapidity.

VEGETABLE PRODUCTIONS.—The plants of Australia are to a very considerable extent so peculiar in their organization that a large proportion of the genera, and some of the entire natural orders are quite unknown beyond its shores or those of the dependent islands. But it is principally in the south that this peculiar vegetation appears; for it changes in character as it approaches the north, till it finally assimilates itself to that of Malaysia. The great mass of the vegetable productions of Australia belongs to the natural orders proteaceæ, myrtaceæ, and compositæ; but the most common genera are the eucalyptus and acacia, which, if taken together, and considered with respect to the bulk of vegetable matter which they contain, nearly equal all the other plants in the country. Of the former above 100 species have been discovered, most of which are trees remarkable for their great size and height. Of the acacias nearly 100 of the leafless species have been observed. The epacridæ, with their allied genera, are nearly as numerous, and hold the same rank in Australia as the ericæ at the Cape of Good Hope. The orchideæ are found in great variety, being highly curious in the intertropical parts of the country, and chiefly land plants. Of palms only six species have been discovered; and of the genus causurina, 13 species. The coniferæ are few in number of species, but very fine; in particular, the

celebrated Norfolk Island pine (araucaria excellsa) occupies an extent of 900 miles along the coast. Among the aspodeleæ the genus xanthorrhea is the most remarkable; all the species yield a gum, and the xarborea produces above its leaves a foot-stalk resembling a sugar-cane, 20 feet long, and terminating with a spiral spike not unlike an ear of wheat. Their stem is used by the natives for spears; the tree yields a fragrant yellow resin which has been found very balsamic. Of the genus urticæ there are numerous species; many of these nettles reach 20 feet in height, and are of proportionally robust habit, with leaves so highly stimulating as to blister severely on the slightest touch. The leguminosæ and compositæ comprehend one-fourth of all the dicotyledonous plants, while the grasses form an equal proportion of the monocotyledonous; but of the latter only one-tenth part of the species have been observed in other parts of the world. Of the cryptogamic plants the greater number are the same as those of Europe, but some of them are also peculiar to Australia. The trees used by the colonists for domestic purposes are the iron-bark tree (eucalyptus resinefera) for building, but generally for fencing; the blue-gum (eucalyptus pipenta) for shipbuilding and wheels; the black-butted gum, for the same purposes; the grey gum for fencing and building; the stringy-bark for boards, building, &c.; the box, for wheels and ploughs; the forest-oak (casuarina torulosa), and the swamp-oak (casuarina paludosa), for cabinet work and shingles; the cedar (cedrela australis), for cabinet work; the turpentine tree, for boats; the sassafras, for flooring; the mountain ash, for carriage work; the sallow, for gig-shafts; the pear, for gun-stocks; the apple, for building; the white cedar, for building and boats; the Norfolk Island pine, for cabinet work; and the bark of the curragong, for cordage. Some of these trees rise to an astonishing height; and Mr. Martin says, that he has seen a vast forest with scarcely a tree of which the height was not 50 to 80 feet without a branch, while the general height of the whole trees was nearly 150 feet. Several trees yield gum-arabic, kins, and manna.

The culinary vegetables and fruits are numerous and of a delicious flavour; but they have been almost all introduced by the British colonists. Among the vegetables may be mentioned potatoes, cabbages, carrots, parsnips, turnips, cauliflowers, onions, asparagus, peas, beans, cucumbers, raddishes, lettuce, spinage, brocoli, capoicums, artichokes, chardoons, celery, knohl, brengall or egg-plant, vegetable marrow, sweet potatoes, and sea-kale. Among the fruits may be mentioned grapes of every variety, strawberries, raspberries, pine-apples, oranges, lemons, citrons, guavas, rose-apples, mangoes, English and Brazilian cherries, pears, apples, peaches, apricots, plums, figs, mulberries, loquats, grenadillas (great flowering passion-flower), pomegranates, cherasnolia, melons both sweet and water, bananas, plantains, quinces, litches, olives, chestnuts, filberts.

Altogether, the Australian flora was estimated by Mr. Brown, in 1814, to contain 4200 species; many more have since been discovered; but our limits prevent us from giving any general account of them, or even naming them. A few, however, are sufficiently remarkable to require particular notice. The New Holland lily is a stately plant which grows to the height of 20 to 25 feet, bearing on its crown blossoms of the richest crimson, from which the birds sip a delicious honey. The pitcher-plant is remarkable for having among its leaves ascidia or pitcher-shaped vessels which contain several ounces of a watery fluid with a slightly sweet taste. A singular and interesting plant has lately been discovered, which produces a fruit larger than a Spanish chestnut, with the same taste. The foliage is beautifully green, and affords a good shade.

ANIMALS.—The native animals of Australia are few in number of species, and of a very peculiar character. There are 58 species of mammalia, of which 46 are peculiar to the country, and of the other 12 species five are cetacea and four seals, leaving, in fact, only three land mammals common to Australia with the rest of the world, and of these one is the large Madagascar bat, another, a species of jerboa, and the third, a species of dog. There are no quadrumana, insectivora, pachydermata, or ruminantia; but there are two species of cheiroptera, eight carnivora, six rodentia, four edentia, and thirty-six marsupialia, of which four-sevenths are exclusively limited to Australia and the adjacent islands. The largest quadruped is the kangaroo, of which, however, there are many varieties, differing in size from the kangaroo rat to the forester, which stands four or five feet high; but these beautiful animals are fast disappearing before the pursuit of the colonists. The opossum tribe are very numerous, and generally take up their abode in the hollows of decayed gum trees, where they are pursued by the natives with a singular dexterity in climbing. The native dog is, next to the opossum and the kangaroo, the most numerous species of quadruped. It

somewhat resembles the Indian jackall, being about two feet long, and two feet high, with a head like a fox, and erect ears; the colour is generally a reddish brown. It does not bark, but sometimes yelps, and utters a dismal howl. It is extremely tenacious of life, very destructive to sheep and poultry, and is consequently hunted without mercy by the settlers. A considerable degree of animosity likewise exists between European dogs and these wild aborigines. But the most remarkable animals are those which we have mentioned above as belonging to the edentata, though, strictly speaking, they bear little analogy to the other animals of that order. Two of the four species are echidni or porcupines, the one entirely covered with thick spines, and the other clothed with hair, in which the spines are half hidden. The other two species are ornithorhynci, animals which have the body and habits of a mole, the feet and bill of a duck, and the internal structure of a reptile, leading a burrowing life amidst the mud of rivers and swamps. Horses, cattle, sheep, and swine, have been introduced by the European colonists, and the country has proved to be remarkably well adapted for the breeding of these useful animals. Indeed no other country in the world seems to be so well adapted for the rearing of sheep, and the production of fine wool. The wool of Australia now enjoys the highest reputation in Britain and America; and most of the beautiful and soft woollen fabrics which go by the names of Indianas, merinos, and schallis, are manufactured from it. Many of the cattle have become wild, and Major Mitchell mentions that on two occasions he found himself surrounded by wild herds, the one amounting to 800, and the other to about 1000 head. Goats and rabbits have also thriven and multiplied, but not to the same extent. A fine breed of asses has also been introduced from South America, but they are not numerous.

Birds are numerous, of great variety, and many of them of beautiful plumage. No order of birds is without its representative in Australia; and there are but two species entirely peculiar to it, though these are more numerous than the others. The most singular bird is the emu, which is fast disappearing. The gigantic crane is a stately bird about six feet high, gregarious and carnivorous, easily domesticated, and frequently seen on the borders of rivers and lakes, where also the black swan abounds. The bustard or native turkey weighs from 15 to 18 lbs., and forms agreeable food. Eagles and hawks are every where to be met with. There are about thirty varieties of pigeon; and countless varieties of beautiful parrots, parroquets, and cockatoos; green, red, crimson, and purple lories, with many other elegant and curious birds; as that singular one, the lyre-tail, which belongs to the gallinaceous order; spur-winged plovers; pheasants of two species; and three kinds of magpie. The common crow and the swallow are every where found; and the Australian sparrow is a very pretty bird with varied plumage, in which a red or scarlet tinge is intermixed. A butcher bird, which destroys snakes and other reptiles, is named the laughing jackass, from its note resembling the coarse and boisterous laugh of a man, but louder and more dissonant. The coachwhip is a small bird whose note resembles the crack of a whip. Snipes, quails, kingfishers, and coots are abundant. The insectivorous birds are comparatively few; but the suctorial species, or honey-suckers, are numerous. The scansorial creepers are limited to two species. The toucans find their Australian representative in the channel-bill; the fly-catchers and warblers resemble those of Africa; there are two or three small finches of Indian genera; and the cuckoos and orioles are not much unlike those of Europe, Asia, and Africa. The aquatic tribes are nearly similar to those of other countries, as the pelican, penguin-goose, duck, teal, widgeon, frigate-bird, noddy, petterel, gull, and other sea birds. The genus cerespis, however, is found only in New South Wales; it is of a light grey colour, and as large as a goose. The musk duck is a curious bird, and has wings so short that it cannot fly.

Insects are very numerous, and of every variety; locusts are common in some parts of the colony of New South Wales; bees are of three species, and all without stings, producing a great deal of delicious wild honey; English bees, which have been recently introduced, multiply fast; the ants are of several varieties, those named the gigantic ant are nearly an inch in length. Their houses are not so high as those of Africa, but they are more solid and compact. Some species are, at one period, furnished with wings, and may be seen issuing from a hole in the earth, flying about in every direction, and then suddenly disappearing, strewing the ground with their wings. Flies are a nuisance in summer, and the blow-fly taints and putrifies every thing it touches. Spiders are generally large; caterpillars sometimes, at intervals of years, swarm in incredible numbers, blighting the finest crops in a few hours. Musquitoes are occasionally troublesome, but are disappearing before advancing civilization; and

those other creatures which accompany the want of cleanliness in England, are equally abundant and unpleasant in Australia. In South Australia fleas exist in incredible numbers.

Reptiles are not very numerous. There are, however, several varieties of snakes, some of which are poisonous. The largest is the diamond snake, which reaches the length of fifteen feet, but is not poisonous. Several water snakes have been found, and some have been seen at a good distance out at sea. There are also scorpions, centipedes, and tarantulas; with numerous lizards, frogs, and adders.

Fish are plentiful along the coasts, but few are found in the rivers, especially in those on the east side of the Blue Mountains, owing to the rapidity of their currents. Whales frequently come into the bays to calve, and seals are found in different coves, especially towards the south. The codfish is taken in the fresh water rivers west of the Blue Mountains, in great quantities and of a large size. Both these and the eels are delicious food. Perch abound in the rivers of the eastern coast; there are many varieties of other fish, with which the markets are well supplied. Large sharks are also sometimes seen. The shells of the Southern Ocean are highly prized, many of them being of great beauty and of elegant forms. Fresh-water mussels and shrimps are obtained in great numbers. Oysters are extremely plentiful, and, though generally small, have a delicate flavour.

PEOPLE.—The aborigines of Australia are considered as belonging to the Ethiopic or black race of mankind, but differ very considerably from the negroes of Africa, particularly in having the hair black, long, and coarse, with the exception of those on the south coasts, whose hair is woolly. The nose, though large, is not so flat as that of the Africans, indeed it sometimes approaches the Roman form; the features generally are far from being disagreeable; the lips are not thick, and the teeth are white and regular. The forehead is high, narrow, and formed at the crown like the roof of a house. The skin is of the colour of wood-soot, or chocolate. The beard is of the same colour with the hair of the head, and is bushy and thick. The colour, however, of the skin seems not to be every where the same; some, even when cleansed from their filth, are nearly as black as Africans, while others have a tint not deeper than that of the Malays. In form, the Australians are generally tall and slender, with small muscles; and are remarkable for agility rather than for strength. They are weak and puny in comparison with the negroes of Africa; and are as much inferior in moral and intellectual qualities and attainments. The Australians are the only people that go completely naked. Of arts and manufactures they have scarcely any idea. Their nearest approach to ingenuity is the fishing net, which is prepared by the women from fibres or grassy filaments. Their only cutting tools are made of stone; and their arms of offence consist of spears, bomerangs, a singular sort of projectile, waddies or clubs, and tomahawks. Of agriculture, even in its rudest form, they have not the smallest knowledge; they have no herds and flocks; nor do they seem even to have any notion of barter, except where intercourse with Europeans has taught them to give their labour for a regular supply of food. They have no houses, but live in holes, or under the shelter of bark screens rather than huts. They seem to have no notion of property; but, on the contrary, hold every thing in common, except their women. They are among the lowest and most degraded of mankind, and are as completely barbarous as can well be imagined. In short, they may be described as rather gregarious than social; for though some personal respect is occasionally seen to be paid to a kind of chief among a tribe, it would seem to be entirely personal, and independent of any elective hereditary right. They believe in good and evil spirits; but it does not satisfactorily appear that they offer them any worship or homage. They seem to be incapable of civilization, and will probably, like the far nobler red men of North America, disappear entirely before the white intruders. In general it may be said that the whole of the aborigines belong to one stock; though it is not a little singular that their languages differ so much, that tribes at short distances from each other, unless inhabiting the banks of the same river, are entire strangers, while almost every community or family, as it may be termed, has its own peculiar dialect. Of their number no estimate can be formed; but depending entirely, as they do, for subsistence on the produce of fishing or the chace, or on gum or bulbous roots, it cannot be very great; and indeed the country is known to be very thinly inhabited.

Of the white inhabitants we need say nothing more than that the great bulk, or almost the whole of them, are of British origin; only a few foreigners being intermixed with them.

DIVISIONS.—The greater part of Australia is still without any political or administrative divisions; but several British colonies have been planted on the shores; and these we shall proceed to describe, under their respective names of *New South Wales, South Australia, Western Australia,* and *North Australia.* Various portions of the coast have also received particular names from the navigators who explored them; as, *New Holland* and *Tasman Land,* on the north-west coast; *Arnheim's Land,* between New Holland and the Gulf of Carpentaria, corresponding with what is now called North Australia; *Carpentaria,* the peninsular region between the Gulf of Carpentaria and the Eastern Ocean; *De Witt's Land; Endraght Land; Edel Land; Vlaming Land; Leeuwin Land,* on the west coast; and *Nuyt's Land,* on the south coast. These portions were discovered and named by Dutch navigators in the early part of the seventeenth century. The whole of the east coast was first explored by Captain Cook in 1770, and named by him New South Wales; the greater part of the south coast was explored in 1800 and 1802, by Captains Grant, Baudin, and Flinders, who bestowed no general names on their discoveries.

§ 1. *New South Wales.*

GENERAL DESCRIPTION.—This territory, according to the terms of the Governor's commission, "extends from the northern cape or extremity of the coast, called Cape York, in the latitude of 10° 37′ S., to the southern extremity of the said territory, or Wilson's Promontory, in lat. 39° 12′ S., including all the country inland to the westward, as far as the 129th degree of E. long., with all the islands adjacent in the Pacific Ocean within the latitude aforesaid of 10° 37′ and 39° 12′ S., and also including Norfolk Island, lying in or about the lat. of 29° 3′ S., and 168° E. long., saving and excepting that part of the said territory hereinbefore described, which is called and known by the name of 'The Province of South Australia,' and which lies between the meridian of the 132d and 141st degrees of east longitude, and between the Southern Ocean and the 26th degree of south latitude, with all and every the islands adjacent thereto, and the bays and gulfs thereof." But within these wide limits only a comparatively small portion of country has yet been explored and colonized.

New South Wales forms the south-eastern corner of Australia, extending along the coast from about Moreton Bay, in 27° S. lat., to the eastern border of South Australia, at Discovery Bay on the south coast, and inland to the river Darling, or the hills immediately beyond it; being altogether about 860 miles in length, from Moreton Bay to Port Phillip, and 550 miles in breadth, on the parallel of Sydney. The country is naturally divided into two very distinct portions: the first of which extends along the south and east coasts, between the sea and the mountains, which form a continuous watershed, in some places scarcely exceeding 100 miles, but for the most part at a much less distance inland; and the second forms a boundless extent of plains, interspersed with hills, and intersected by rivers, all of which flow northward, westward, or southward, to form the Murray, the largest river yet discovered in Australia, and which flows to the south-westward to Lake Alexandrina at Encounter Bay. Within the limits of the defined counties, which extend along the east coast for 325 miles, with a breadth from 80 to 190 inland, sandstone predominates so much as to occupy about six-sevenths of the whole surface; and wherever this happens, little besides barren sand is found in the place of soil; deciduous vegetation scarcely exists; no turf is formed, for as the trees and shrubs are inflammable, conflagrations take place so frequently in the woods during summer, as to leave very little vegetable matter to be converted into earth. In the regions of sandstone, in short, the territory is worthless, and is, besides, very generally inaccessible, thus presenting a formidable obstruction to any communication between isolated spots of a better description, which occur only where trap, limestone, or granite rocks exist. The aggregate extent, however, of these fertile spots is so small, that out of twenty-three millions of acres, only about 4,400,000 have been found worth possessing, while the owners of this appropriated land within the limits have been obliged to send their cattle beyond them for the sake of pasturage. And so extremely arid is the country beyond the mountains, that all the surface water which flows from the vast territory west of the dividing range, and extending north and south between the river Murray and the Tropic of Capricorn, a distance of about 1000 miles, is insufficient to support the current of one small river throughout the year. The country, however, to the south of the Murray is not so deficient in this respect, for there the mountains are higher, the rocks more varied, and the soil consequently better. Every

variety of feature may indeed be seen in these southern districts, from the lofty alpine region on the east, to the low grassy plains in which they terminate on the west. The Murray and its affluents flow through extensive plains, irrigating and fertilizing a great extent of rich country, the soil of which is formed by the disintegration of trap, granite, or limestone. Falling from mountains of great height, these rivers have a perpetual current, whereas in other parts of Australia the rivers are too often dried up, and seldom indeed deserve any other name than chains of ponds. Hills of moderate elevation occupy the central region between the Murray and the southern coast; they are thinly or partially wooded, but are covered with the richest pasturage. The lower country along the skirts of these hills, on both sides, is mostly open, slightly undulating towards the coast on the south, and generally well watered. The grassy plains which extend northward from these thinly wooded hills to the banks of the Murray, are furrowed by the channels of numerous streams, and by the more permanent and extensive waters of numerous deep lagoons; and, indeed, a finer country for the pasturing of cattle can scarcely be imagined. In the western portion small rivers radiate from the Grampians, an elevated and isolated mass, presenting no impediment to a free communication through the fine country around its base, to which Major Mitchell, who first explored it, gave the name of *Australia Felix*. Towards the sea on the south, and adjacent to the open downs between the sea and Port Phillip, is a low tract of country consisting of very rich black soil, which seems to be well suited for the cultivation of grain. Between Port Phillip and Sydney a great part of the country remained till recently unexplored; but during last year (1840) Count Streletsky, a Pole, performed a zigzag pedestrian journey of 2200 miles through it. Towards the sources of the Morumbidgee and its affluents, he found the country particularly favourable for grazing and agriculture, both the hills and the valleys furnishing abundant natural and artificial crops. Farther south, and beyond the range of the remotest squatters, in the valleys of the Murray and its upper affluents, he found the country rich and well watered. Crossing the dividing range, he entered a country to which he gave the name of *Gipp's Land*, in honour of the governor, and which, on account of its extent, its richness as a pastoral country, its open forests, means of inland navigation, rivers, timber, climate, proximity to the sea, and its gradual elevation, rather hilly than mountainous, holds out cheering prospects to future settlers. It extends along the coast, between the sea and the Australian Alps, from the meridian 148° on the N.E. to Corner Inlet and Western Port on the south and south-west. Barometrical measurements give to Gipp's Land, on a line drawn between the dividing range and the sea, from the N.E. to lat. 38° 8′ S. an average elevation of 268 feet. Scarcely any spot, in the opinion of Count Streletsky, either within or without the boundaries of New South Wales, on a large or a small scale, can boast of greater advantages than Gipp's Land. On an extent of 5600 square miles it has a sea-coast line of 250 miles; two harbours already known, those of Corner Inlet and Western Port; eight rivers, besides a navigable lake and lagoons; 3600 square miles of forests, plains, and valleys, which, in richness of soil, pasturage, and situation, cannot be surpassed; 2000 miles of coast range, with the most excellent quality of blue-gum and black-butt timber. The natives he found peaceable and inoffensive.

MOUNTAINS.—These, commencing near the coast of Portland Bay, in the south-west, extend in an almost continuous line, parallel to the coast, beyond the northern limits of the settlements. In Australia Felix are the *Grampians*, the main body of which extends above 50 miles from north to south, with an outlying ridge to the westward named *Victoria* range. From their eastern flank a range of grassy hills, named the *Australian Pyrenees*, diverges to the E.N.E. and connects the Grampians with the *Warragong* or *Australian Alps*, the highest range yet discovered in the country. These may be described as extending N.N.E. from Wilson's Promontory to the 36th parallel, where they attain their greatest elevation; they are then divided into two ranges, the one running to the north-west between the valleys of the Murray and the Morumbidgee, and the other to the north-east, where it forms the watershed between the coast land and the great plains of the interior. *Mount William*, the highest of the Grampians, rises only 4500 feet above the level of the sea; *Mount Cole*, the highest of the Pyrenees, about 3000; but the highest of the Alps being covered with perpetual snow, their elevation, though not ascertained, cannot be less than 15,000 feet. To the westward of Sydney the ranges have been named the *Blue Mountains*, and long formed an impassable obstacle to the progress of discovery in that direction. It was only in 1813, five-and-twenty years after the foundation of the colony, that a road was found across them. These mountains form the connection between the Australian Alps and the *Liverpool Range*, which extends east and west, through three or four degrees of longitude, under the 36th parallel, and presents a very formidable obstacle to any passage across it. The Blue Mountains attain no great elevation, *Mount York*, their highest peak, being no more than 3192 feet above the level of the sea; but the valleys and plains which occur among its ridges are very elevated. King's table-land is 2727 feet high; the Vale of Clwydd, 2496 feet; and Bathurst plains, 1970 feet, above the level of the sea. The highest peaks of the Liverpool range rise between 6000 and 7000 feet. This range is crossed by some frightful ravines, one of which, named by Mr. Oxley, Pandora's Pass, is described by him as being from two to three miles wide at the top, and 3000 feet in depth, while its width at the bottom, which forms the bed of a river, is only between 100 and 200 feet. More practicable passes, however, have been, and are still being discovered across both the Liverpool range and the Blue Mountains. The only volcanic mountain yet discovered in Australia, is situate between the Grampians and the sea, at Portland Bay; it is called by the natives *Murcoa*. but Major Mitchell has

given it the name of *Mount Napier*. It is extinct, but vesicular lava is abundant in the neighbourhood.

RIVERS.—The Rivers may be arranged in two classes; those which flow from the dividing range directly to the sea; and those which flow to the interior, and find their ultimate issue by the Murray. Proceeding along the coast from north to south, the rivers of the maritime region occur in the following order:—The *Brisbane* and the *Logan*, which fall into Moreton Bay; the *Perry*, into Shoal Bay; the *Apsley*, into Tryal Bay; the *Hastings*, which terminates in Port Macquarrie; the *Manning*, which divides, near its mouth, into two branches which form Farquhar Inlet and Harrington inlet; the *Wallamba*, *Richard*, and *Maclean Rivers*, which fall into Wallis Lake at Cape Hawke; the *Myall* and *Karuah*, into Port Stephens; the *Hunter* rises from the southern flank of the Liverpool range, between 151° and 152° E. long., and flows first to the south-west, where it is joined by the *Goulburn*, and then turns to the east by south, entering the sea at Port Hunter; the *Hawkesbury*, which terminates in Broken Bay, is formed by the *Macdonald*, *Cole*, *Nepean*, *Wollondilly*, *Cox's River*, and numerous other streams, which drain a large portion of the eastern flank of the Blue Mountains; the *Shoalhaven River* enters the sea at Shoalhaven, to the south of Sydney. In Gipp's Land are the *Thomson*, *Riley*, and *Macarthur*, which flow into Lake King; the *Perry*, *Dunlop*, and *Barney*, which enter the sea in one stream farther south; the *Macleanochie* and the *Latrobe*, which also form one stream, and enter the sea to the eastward of Corner Inlet. Farther west the only important stream is the *Glenelg*, which falls into Discovery Bay, to the eastward of Cape Northumberland. These rivers having very short courses, are comparatively unimportant; but several of them are navigable for small vessels to a considerable distance inland.

The MURRAY or MILLEWA has its sources in the elevated valleys of the south-western flank of the snowy range of the Australian Alps, between 36° and 36° 40′ S. lat., and on both sides of the 148th meridian. From the point where it leaves the mountains it flows, with various windings, in a general direction west-north-west till it reaches the 140th meridian, beyond which it turns to the south, and enters Lake Alexandrina at Encounter Bay. It is navigable for boats through the greater part of its course, the length of which, including windings, is probably not much less than 3000 miles. Its principal affluents from the south are the *Wimmera*, *Loddon*, *Yarayne*, *Hovell*, *Goulburn* or *Bayuarra*, the *Ovens*, and the *Mittamitta*. The affluents from the north are the *Morumbidgee* and the *Darling*. The Murray was first explored in 1830 by Captain Sturt, who sailed down the stream from the mouth of the Morumbidgee to Lake Alexandrina. The Morumbidgee rises from the northern side of the snowy Alps, and, flowing in a westerly direction, joins the Murray near the 143° E. long., after a course of 1000 miles. It receives from the north the large river *Kobire* or *Lachlan*, which drains the western slopes of the mountains to the south-west of Sydney. The *Darling* or *Karauha* rises south-west of Moreton Bay, and, flowing south-west, joins the Murray between 141° and 142° E. long. Its principal affluents are the *Dumaresque*, *Gwydir*, *Namoy* or *Peel*, *Castlereagh*, *Wambool* or *Macquarrie*, and *Bogan*. But the Darling is rather a water course than a river; for, in dry seasons, it has sometimes no current, nor even water, for many miles; in the summer of 1840, its channel was dry for thirty miles up from the Murray. When first visited by Captain Sturt, he found its water intensely salt; but, six years later, Major Mitchell found it fresh at the same place, but salt for 14 mile, about 50 miles lower down. Its affluent the Macquarrie and also the Lachlan, when first explored by Mr. Oxley, were found to terminate in wide expanses of water, which gave him reason to conjecture the existence of one or more large inland seas; but these expanses have been since found to exist only in wet seasons, while, on the contrary, in dry seasons, they are only dry clayey tracts, traversed by chains of ponds; so that though they are both large streams in the upper part of their courses, they contribute really very little water to their main rivers. In short, the basin of the Murray and its affluents is estimated to comprise an area of 400,000 square miles, but, as all their water is received only from the mountains on the eastern and southern borders, while the country through which they flow is very arid, instead of increasing, like other rivers, as they proceed, they rather decrease gradually, till at last the bulk of water carried by the Murray to the sea is too small to force a clear navigable outlet. It therefore expands into a large lagoon, about 50 or 60 miles long and 30 broad, but is only four feet deep, and salt for one-half of its breadth.

LAKES.—The Lakes are small and unimportant, though very numerous. *Lake George*, in Murray County, was, in 1828, a sheet of water 17 miles long and 7 wide, but in 1835, had dried up to a grassy plain.

NATURAL PRODUCTIONS.—The grand staple product of Australia is wool. Since sheep were first extensively introduced, great improvement has taken place in the quality of the wool, and it has been much more extensively used in the manufacture of fine goods in Britain. In 1830 only 973,330 lbs., or about 5000 bales, were imported into England from New South Wales; while, in 1839, the amount was 32,944 bales; and it is annually increasing. In consequence of the aridity of the climate, and the general barrenness of the soil, agriculture is an anxious and uncertain pursuit. Owing also to the greater profit which is more easily made by sheep, the attention of the colonists has been so much directed to that pursuit, that comparatively little attention is devoted to agriculture, and the colony is very much dependent on supplies of corn from abroad. It has been hitherto supplied chiefly from Van Dieman's Land and the Cape of Good Hope, and sometimes even from North America; but, even with all these supplies provisions have recently risen sometimes almost to famine prices. The aridity which makes agriculture so hazardous and unproductive, is owing, however, not so much to the small quantity of rain which falls, as to the unequal distribution of that quantity throughout the year, and throughout periods of years; deluges of rain being often followed by long-continued droughts. If the actual quantity of rain fell regularly and seasonably, agriculture might in some places succeed as a pursuit, where at present it is merely carried on as subsidiary to grazing, and where it is only possible to carry it on in this way; but in the course of time, when capital accumulates, this irregularity may be partly remedied by artificial irrigation, and large tracts of land now consigned to sterility may be rendered productive. This, however, on a large scale would not be profitable in the present state of the colony; and for many years to come it will be more profitable for the colonists to devote their

principal attention to sheep and cattle, for which they have advantages over all the other nations of the world, and to import all the grain they require, except what is grown in those places which are favourable to its cultivation, such as the alluvial banks of the rivers in the vicinity of the coast. In 1838, the quantity of land under cultivation amounted to 92,912¾ acres, whereof 48,060 were in wheat; 25,043, in maize; 2922, barley; 3767, oats; 429, rye; 39¼, millet; 1788, potatoes; 925½, tobacco; sown grasses, 9939. And the produce, in that year, was 469,140 bushels of wheat; 553,268 bushels of maize; 32,103 of barley; 13,416 of oats; 4878 of rye; 353 of millet; 3496 tons of potatoes; 4952 cwt. of tobacco; and 6960 tons of hay. But though the country is unfavourable to the production of grain, it is likely that the culture of the vine would succeed; and the experiment has been made to a certain extent. Wine of superior quality has already been produced in some places, and there is no doubt that in many situations good wine may be made in abundance. Coal has been found in various places, as in the district of Hunter's River, among the Blue Mountains and the Darling ranges, and in the Port Phillip district. Mines have been wrought for several years at Newcastle on the river Hunter, by the Australian Agricultural Company, who have exclusive right of working it within the limits of the territory. Coal has also been found near the heads of several of the branches of the Hunter, more than 100 miles from Newcastle, as well as at various intermediate points; and from these indications there seems reason to believe that a continuous bed of coal extends throughout the whole valley of that river, which may, in consequence, hereafter become the great manufacturing district of Australia. New South Wales likewise possesses abundance of iron ore of the richest quality; and in these two articles, coal and iron, is supplied with abundant elements for the future industry and prosperity of a numerous and active population.

The whale fishery has in past years been a source of wealth to several of the enterprising colonists, and it may continue to be so; but this pursuit partakes more of the nature of a gambling speculation than of a regular branch of industry; its profits are so uncertain and precarious. It is nevertheless eagerly pursued. In 1828 the produce amounted to the value of £38,000; in 1835, it had increased to £214,000.

POPULATION.—Besides the few aborigines, of whom we need take no further notice (See *anté*, *p.* 985), the population consists of British emigrants and their descendants, with the intermixture of a very few other Europeans. The colony was established in January 1788, as a penal station for criminal convicts; and for nearly thirty years continued to make very slow progress in population, very few free emigrants finding their way to it: but, after the general peace in 1814, public attention was directed to Australia as a suitable place for emigrants of a better description than the early settlers; and within the last five-and-twenty years the population has, in consequence, experienced a rapid and continually advancing increase. But though the country has been largely indebted to the labour of the convicts, it may yet be doubted whether or not the value of their forced industry is not more than counterbalanced by the moral contamination which they have communicated to the whole society. The first colony, established at Sydney in 1788, consisted of 1030 individuals, of whom more than 700 were convicts. In 1810, the population of the colony amounted to 8293; in 1821, to 29,783; in 1828, to 36,598; in 1833, to 71,070; in 1836, to 77,096. In 1837 there arrived 4275 free emigrants, and 2345 convicts, and there were in the colony 2270 births, and 1799 deaths. In 1838, the number of free emigrants was 8840; of convicts, 3073; of births, 2836; of deaths, 2104. In 1839, the free emigrants were 13,358; convicts, 2298; births, 3304; deaths, 2481. Thus the increase of population during these three years was 26,473 free emigrants; 8791 convicts; and 8410 births; making altogether a general total of 43,674, while the decrease by death was 6384. The population, therefore, at 31st December 1839, would amount to 114,386.

The greater part of the convicts, upon their arrival, were formerly provided for by being assigned as servants to the free colonists; but, according to a new system recently introduced, all convicts arriving in future are to be transported to Norfolk Island, and are not to be assigned to private individuals during any part of their servitude. After serving for a certain time with a good character, the prisoner becomes entitled to a "ticket of leave," which gives the holder of it all the advantages of a free person throughout the district over which the leave extends. When the ticket is held for a certain number of years without forfeiture for misbehaviour, the holder is entitled to a "conditional pardon," which is not liable to be forfeited at the will of the Government, but is limited in its sphere of operation to the colony, in which respect it differs from an "absolute pardon," which restores the convict to all the rights and

privileges of a British subject. Under the operation of this system, many convicts have become useful members of society, and not a few of them have risen to be the most enterprising and wealthy among the merchants and cultivators. But people of this class are still distinguished by the name of "emancipists;" among many of the free emigrants there is a strong prejudice against associating with them; and through the force of this prejudice a bill introduced by the Government into the legislative council last year (1840) for constituting municipal corporations in the colony, and allowing emancipists to hold municipal offices, was defeated. But, as the emancipists have not "the nobility of the skin" to contend against, like the free negroes of America, this prejudice will no doubt gradually give way, even as respects themselves, while with respect to their descendants, it can hardly, if at all, be said to exist.

RELIGION.—The colonists, like their countrymen at home, are generally professors of Christianity, but the variety of sects and creeds is just as great among them as in Britain. In 1836, there were 77,096 Protestants, 21,895 Roman Catholics, 477 Jews, and 100 Pagans. The ministers of all sects are provided for by the Government, and a seventh part of the whole territory is set apart as church and school lands for the general purposes of religion and education without reference to sect. The English Episcopal church is under the charge of the Bishop of Australia, who is appointed by the Crown, and resides at Sydney. There are also branches of the Church of Scotland, and of various others of the British sects. The Roman Catholics are under the charge of a Vicar-General.

EDUCATION.—Considerable efforts have been made for the diffusion of education; but no general system has yet been established by public authority, though there are many schools which are supported by the Government, and also numerous private seminaries. Of the former there were in 1837–8, thirty-seven for children of members of the Church of England, and eleven for Roman Catholics, besides a considerable number supported partly by Government and partly by private contributions. An attempt was made by the Government in 1839 to introduce a general system of education on popular principles, which was defeated by the Church party, headed by Bishop Broughton. At Sydney there are two colleges; one named the Sydney College, established by private subscription in 1830; and the other named the Australian College, instituted in 1831 on the model of the Scottish universities, with a principal, and professors of English, Latin, Greek, Mathematics, and Natural Philosophy; and combining a series of schools for elementary instruction, with a gradually extending provision for the higher branches of education. At Liverpool and Paramatta there are two establishments called the Male Orphan School and the Female Orphan School, each containing 125 destitute children, who are reared from infancy, educated and apprenticed out, and subsequently portioned when married.

GOVERNMENT.—The executive government is vested in a governor, who is aided by a council, consisting of the colonial secretary and treasurer, and the bishop of Australia; the legislative power is vested in a council, consisting of the governor and executive council, with the addition of the chief-justice, the attorney-general, the chief officer of the customs, the auditor-general, and seven private gentlemen of the colony, who are appointed by the Crown for life. The laws of England are those of the colony, except only in so far as they are affected by the acts of the legislative council. The laws are administered by a supreme court, consisting of a chief judge and two puisne judges, an attorney-general, and a solicitor-general. Circuit courts are held in various places by these judges, for the same purposes as those held by the judges of England in their circuits. There are also courts of general and quarter-sessions held by the justices of peace, with the same powers as those of England, and with the summary cognizance of all crimes, not punishable by death, which are committed by convicts whose sentences have not transpired, or have not been remitted. There is also a vice-admiralty court for maritime causes; an archdeacon's court for clerical matters; and courts of requests for the summary determination of claims not exceeding the value of £10 sterling, with certain exceptions. Juries have been introduced in both civil and criminal cases. Lawsuits are very frequent, and large fortunes have consequently been made by barristers and solicitors. The executive administration of the law is vested in a sheriff of the colony, who has a deputy in each of the counties. The police forms an important establishment, and is well managed. There are benches of stipendiary as well as unpaid magistrates in Sydney and the other principal towns, aided by head constables, and a civil and military police force at each station. The only military force consist of regiments of the line; no militia force has ever been organized. The police law is very strict.

The rapid extension of settlements over Australia renders it expedient that new arrangements should be made from time to time, for the administration of its affairs; and her Majesty's Government have come to the conclusion that it is desirable that the present territory of New South Wales should be divided into three distinct portions or districts, under the names of a northern, a middle, and a southern district. Suspending for the present any directions about the northern district, the Secretary of State, in his dispatch of 31st May 1840, announces that the middle and southern districts are to be divided by the boundaries of the two southern counties of New South Wales, as proclaimed by the governor on 14th October 1829, and from the limits of these counties by the whole course of the river Morumbidgee and the Murray, till it meets the eastern boundary of South Australia; and that the crown lands in both districts shall hereafter be disposed of at the fixed price of £1 sterling per acre. Against this proposal the legislative council have made a strong remonstrance, as tending greatly to injure the prosperity of the middle district; but, if there must be a division, they wish the southern boundary extended along the coast to Cape Howe, and from that point westward along the course of the Murray.

FINANCES.—The public revenues are derived from various sources; their nature and amount are stated in the following table, for the year ending 31st December 1840:—

SYDNEY.			
Customs,	£182,058	6	6
Duty on Spirits Distilled in the Colony, and Licenses to Distil,	13,228	14	6
Licenses to Retail Fermented and Spirituous Liquors,	13,558	10	0
Auction Duty, and Licenses to Auctioneers,	15,645	18	10
Post Office,	13,413	1	0
Fees of Public Offices,	15,318	10	10
Fines Levied by Courts of Justice and Petty Sessions,	5,956	8	1
Licenses to Hawkers and Pedlars,	63	0	0
Collections by the Agent for the Clergy and School Estates,	4,453	13	10
Crown Lands,	109,484	10	11
Licenses to Depasture Stock on Crown Lands,	7,735	0	0
Assessment on Live Stock beyond the Boundaries of Location,	8,542	8	6
Licenses to Cut Timber on Crown Lands,	657	0	0
Fines collected by Commissioners of Crown Lands,	131	5	0
Rents of Tolls, Ferries, Markets, and Government Premises,	3,935	2	11
Interest on Public Monies deposited in the Colonial Banks,	1,543	16	6
Crown's share of Seizures made by the Department of Customs,	903	17	4
Collected for Water supplied to Shipping from her Majesty's Dock Yard,	386	9	9
Proceeds of the Sale of Public Property,	667	16	9
Proceeds of the Sale of Property found in the possession of Convicted Felons,	293	4	1
Proceeds of the Sale of Forfeited and Unclaimed Property in the possession of the Police,	168	1	10
Sundry small Receipts,	4	0	0
Surcharges recovered,	299	10	11
	398,548	8	1
Proceeds of the Sale of Wheat and Rice imported by Government,	24,286	13	5
Carry over,	£422,835	1	6

Brought over	£422,835	1	6
Repayment by Poor Settlers of Wheat distributed to them by Government,	335	11	7
Proceeds of the Sale of Provisions and Stores landed from Immigrant Ships,	3,303	19	1
Proceeds of the Sale of Property left on board by Emigrants who Deserted,	14	18	6
	27,941	5	7
	£426,489	13	8
PORT PHILLIP.			
Customs,	£21,496	18	8
Licenses to Retail Fermented and Spirituous Liquors,	1,434	10	0
Auction Duty, and Licenses to Auctioneers,	3,199	4	0
Post Office,	778	8	6
Fees of the Harbour Master's Office,	18	15	0
Fees and Fines collected by the several Courts of Petty Sessions,	1,139	8	0
Licenses to Hawkers and Pedlars,	25	0	0
Crown Lands,	217,127	16	6
Licenses to Depasture Stock on Crown Lands,	5,000	0	0
Assessment on Live Stock beyond the Boundaries of Location,	1,707	5	3
Licenses to Cut Timber on Crown Lands,	272	0	0
Fees and Fines collected by Commissioners of Crown Lands,	250	14	3
Proceeds of the Sale of Government Property,	52	6	0
Surcharges recovered,	76	2	2
	252,578	8	4
Proceeds of the Sale of Provisions and Stores Landed from Immigrant Ships,	1,210	9	8
Repayment for Equipments retained by Surveyors,	195	0	0
	1,405	9	8
	253,983	18	0
Total,	£680,473	11	8

The revenue of the colony in 1824 was only £49,471:3:9, including £279:7:9 for the proceeds of land sold. From that period it has been constantly rising to its present amount.

COMMERCE.—The Commerce consists in exporting the raw produce of the colony, and importing in return the articles required for the use of the colonists. The principal exports consist of wool and whale-oil; and the total amount and value of both

branches of trade, for 14 years, are stated in the following table, which is an abstract of various tables in the Appendix to the Report of the Debate in the Legislative Council, on 10th December 1840, on the subject of the proposed division of territory.

Year.	Imports.	Exports.	Vessels Inwards.		Vessels Outwards.		Quantity of Wool Exported.	Value of Wool Exported.
			No.	Tonnage.	No.	Tonnage.		
1826	£360,000	£106,600	62	17,178	60	17,020	lbs. 552,960	£ 48,384
1827	362,324	76,314	103	26,508	63	14,501	407,116	24,306
1828	570,000	90,050	137	32,559	69	20,186	834,343	48,851
1829	601,004	161,716	158	37,342	168	37,586	1,005,333	63,358
1830	420,480	159,659	157	31,225	147	28,822	899,750	34,907
1831	490,152	324,168	155	34,000	165	35,292	1,401,294	70,979
1832	604,620	384,344	189	41,350	194	42,857	1,515,156	73,559
1833	713,972	394,801	210	50,164	213	49,702	1,734,203	103,692
1834	991,990	587,640	245	58,532	220	53,373	2,246,933	213,628
1835	1,114,805	682,193	261	63,019	269	66,964	3,893,927	259,587
1836	1,237,406	748,624	269	65,415	264	62,834	3,693,241	369,324
1837	1,182,222	747,876	260	67,360	262	64,596	4,273,715	320,527
1838	1,506,803	774,770	291	80,060	273	81,325	5,749,376	435,977
1839	2,236,371	948,776	563	135,474	548	124,776	7,213,584	442,504

Before 1817, the circulating medium consisted principally of the private notes of merchants, traders, shopkeepers, and publicans, sometimes for so small an amount as sixpence. To remedy the evils attending such a state of things, the Bank of New South Wales was established with a capital of £20,000 sterling, raised in £100 shares; which almost from the first has yielded to its shareholders a dividend of from 15 to 20 per cent. The Bank of Australia was instituted in 1826, with a capital of £220,000; but its transactions are limited to discounting bills which have not more than three months to run. It has been highly prosperous, and has paid dividends of from 12 to 15 per cent on the paid up capital. A third bank, named the Commercial Banking Company of Sydney, was instituted in 1834, with a capital of £300,000; and in the same year a London company was incorporated by Royal Charter, under the name of the Bank of Australasia, with a capital of £200,000, for the purpose of establishing banks of issue and deposit, not only in New South Wales, but also in Van Dieman's Land, and other parts of Australasia. The whole amount of British coin in the colony in 1836 was estimated at £445,000; and the amount of bank-notes in circulation, at 31st December of that year, at £99,487. But a great proportion of the circulation is carried on by drafts or cheques on the banks, the mass of pecuniary transactions centering in Sydney, and almost every person of property having an account with one of them, in which, for security, a large portion of his money is lodged.

The more settled parts of the colony are traversed by excellent roads, some of which have been executed by Government at very great expense, especially those leading over the mountains.

DIVISIONS. — The country immediately around Sydney, the capital, is divided into twenty counties, named Argyle, Bathurst, Bligh, Brisbane, Camden, Cook, Cumberland, Durham, Georgiana, Gloucester, King, Macquarrie, Murray, Northumberland, Phillip, Roxburgh, St. Vincent, Wellington, Westmoreland, Hunter. By a proclamation issued by the Government in May 1839, the Crown lands beyond the limits of these counties were divided into nine districts, named: — *Port Macquarrie*, *New England*, *Liverpool Plains*, and *Bligh*, along the northern border, between the sea and the Macquarrie river; *Wellington*, between the Macquarrie and the Lachlan; *Lachlan*, between the Lachlan and the Morumbidgee; *Morumbidgee*, between that river and the Murray; *Manaroo*, on the east coast between the Moruya river and Cape Howe; and *Port Phillip District*, "comprising the whole of the lands lying to the south of the main range, between the rivers Ovens and Goulburn, and adjacent to Port Phillip." In the last named districts two counties have since been formed, the one named *Bourke*, on the north side, and the other *Grant*, on the west side of Port Phillip.

§ *Cities and Towns.*

Sydney, the capital, is situate partly in a narrow valley, and partly on the sides of gentle slopes rising from the shores of two of the branches of Port Jackson, named Sydney Cove and Darling Harbour. The streets are long, wide, and quite English in their appearance; the houses are generally lofty and well-built, being interspersed with cottages fronted by small neat gardens, which in

some parts of the town are attached to every house. Along the water side are wharfs, stores, shipyards, mills, &c.; behind these the houses rise in terraces, giving variety to the scene, and by their neatness and elegance conveying the idea of a prosperous community. Many of the shops are fitted up with great taste; the hotels and inns are numerous and excellent; but the public buildings are neither numerous nor elegant. The government-house, though delightfully situate in a charming desmesne which overlooks the harbour, can scarcely be considered more than an overgrown cottage. The churches, chapels, and meeting-houses are plain and modest structures, except that of the Roman Catholics, in which an attempt at imposing grandeur seems to have absorbed every other idea. The town is about three miles in length, having two-thirds of its circumference washed by the navigable waters of Port Jackson. It was founded by Captain Phillip, the first governor of New South Wales, in January 1788, and now contains a population of about 26,000. Sydney Cove is protected by Fort Macquarrie and Dawe's battery, situate on the two points of land at its entrance. Port Jackson is one of the finest harbours in the world. Its entrance, on the east coast, is three quarters of a-mile wide; within, it expands into a spacious basin 15 miles long, in some places 3 wide, and navigable for ships of any burden 15 miles from the entrance, or 7 miles above Sydney; and for 12 miles farther, the Paramatta river, which falls into it, can scarcely be considered more than an estuary. Ships come up close to the wharfs at Sydney, and the cargoes are hoisted at once into the warehouses. On the lofty south head at the entrance a fine lighthouse was erected by Governor Macquarrie. It stands in 33° 51′ 40″ S. lat., and 151° 16′ 50″ E. long. The light can be seen at the distance of 8 or 10 leagues.

The other principal towns round Sydney are:—*Paramatta*, 18 miles distant by water and 15 by land, at the head of Port Jackson, with 3000 inhabitants, and a large factory or penitentiary for female convicts; *Windsor*, on the Hawkesbury river, 140 miles from the sea, to which it is navigable for vessels of 100 tons; *Richmond*, 36 miles from Sydney; *Liverpool*, on the George river, which falls into Botany Bay, and is navigable for vessels of 50 tons up to the town; *Campbelltown*, 12 miles from Liverpool, all in the county of Cumberland. *Newcastle*, on the coast, at the mouth of Hunter river, is a flourishing town fast rising into importnce, not less from its position at the mouth of a fine navigable river, than from the vicinity of the coal mines, which are now actively wrought. *Maitland*, on the Hunter, 25 miles above Newcastle, is also a flourishing town, and the seat of the executive for the county of Northumberland. *Bathurst*, an inland town, 122 miles W.N.W. of Sydney.

Melbourne, the capital of Port Phillip District, was founded so lately as 1837; but is already a flourishing town, with good houses, shops, inns, hotels, and several thousand inhabitants. It is finely situate on a rising ground three miles from the northern shore of Port Phillip, on the north bank of the river Yarra-yarra, which is navigable up to the town, a distance of 9 miles, for vessels of 200 tons; but for the accommodation of larger vessels a shipping port has been established at *Williamstown*, on the projecting point of the west side of Hobson's Bay. *Port Phillip* is a beautiful land-locked basin, from 30 to 50 miles in length and breadth, according to the mode of measuring it, and having a narrow entrance, about a mile and a half wide, which opens to the south-west. Ships of the largest size can approach within 7 or 8 miles of Melbourne, on the side farthest from the sea, where they may ride in safety in any weather, there being numerous sandbanks about the middle of the basin, which break the force of the waves when the wind is southerly. It is surrounded by a picturesque and beautiful country. The nucleus of a settlement has been established at *Geelong*, about 50 miles W.S.W. of Melbourne, at the western extremity of a deep indentation or gulf, which extends inland from the west side of Port Phillip; and another on the north-west shore of *Portland Bay*, where there is a rich alluvial soil; and inland, a splendid tract of country westward of the Grampians, with luxuriant pastures and abundant water, lies open for location.

§ 2. *South Australia.*

This province was established as an experiment on a great scale of a new system of colonization. The various defects in the management of the original Australian colonies, and more particularly the wide spreading out of the population, which tended to deteriorate society, or at least to obstruct the advancement of social improvement, and the moral contamination produced by so large an infusion of convicts, having engaged the attention of several political inquirers, they promulgated a very simple principle, by which not only these defects should be obviated, but a superior colony established with all the vigour and resources of the others, and securing the enjoyment of comfort, happiness, and morality, on the part of the settlers. The principle was, that convict labourers can be dispensed with, abundance of free labourers supplied, and the evils of dispersion avoided by this obvious expedient, namely, that no land should be granted as a free gift, but sold at a price sufficient to defray the expense of procuring labourers from the mother country to cultivate it, and make it available; and that the whole price should be applied exclusively to that purpose. By this means the proper gradation would be preserved between the capitalist and the labourer, and the land be duly cultivated, because it could only be acquired by persons of adequate means; while facilities would be given for introducing a virtuous labouring population of free emigrants, who would have no prospect of raising themselves above their natural rank and vocation, except by industrious exertion. These projectors had influence enough to force their views on the attention of Government; and in 1834 an act of Parliament was obtained for establishing a colony on the principles adverted to. The act provides for the erection of a province under the name of South Australia, extending from the 132° to the 141° E. long. and from the south coast, including the adjacent islands, northward to the tropic of Capricorn. The whole territory within these limits to be open to settlement by British subjects; not to be governed by laws applying to other parts of Australia, but only by those enacted expressly for this colony; in no case to be employed as a station for transported convicts; no waste or public lands to become private property, save by one means only, viz. by purchase at a fixed minimum price, or as much above that price as the competition of public auction may determine; the whole of the purchase money to be employed in conveying labourers, natives of the British islands, to the

colony, so that the purchasers of land may obtain the greatest amount of labour wherewith to cultivate the land, and of population to enhance its value. The whole process is to be under the charge of Commissioners appointed by the Crown, who are empowered to borrow money, and whose authority is "to continue until the colony having attained a certain population, shall, through the means of a representative assembly, to be called by his (or her) Majesty, undertake to discharge the colonial debt, and to defray the cost of future government; when the colony is to receive such a constitution of local government as his (or her) Majesty, with the advice of the Privy Council, and with the authority of Parliament, may deem most desirable." The population of the province must amount to 50,000 at least, before it be lawful for the Crown to frame a constitution of local government for the colony. The province, as above defined, contains an area of nearly 300,000 square English miles, or 192,000,000 acres.

The most highly-coloured and flattering accounts of the beauty, salubrity, and agricultural capabilities of the province were published in Britain, and thereby several thousand people were induced to try their fortune in this terrestrial paradise, but only to be disappointed; for the country has proved to be, like all the rest of Australia, generally ill adapted for agriculture, and the most of it suited only for pasturage. The principle of concentration has been in consequence entirely abandoned; the sale of land has ceased to be confined to the narrow tract originally laid out in sections; speculators are picking out the best lands, for which they obtain special surveys, in every accessible part of the province; and the people are spreading in all directions, in order to suit themselves to the circumstances of the country; while, at the same time, the moral pestilence, which was dreaded so much, has been introduced by emancipists and runaway convicts from New South Wales and Van Dieman's Land. This experiment in colonization would indeed have proved a complete failure, but for the vicinity of these two older colonies, from which alone the requisite number of sheep and cattle to stock the new settlements of South Australia could have been procured at such an expense as the colonists could bear. So that, instead of the virtuous, happy, and concentrated agricultural population which was contemplated, there will be only a scattered pastoral people in the interior, while those on the coasts are devoting themselves to whale-fishing and maritime and commercial pursuits. Still, however, as might be expected in so large a province, there are tracts of rich soil capable of producing abundant cereal crops; and the climate is much more humid than that of New South Wales, which is sometimes parched up by long-continued droughts, while frequent rains fall in South Australia, brought by the south-west winds, which prevail for nine months in the year. But, notwithstanding these advantages, it is admitted that for a series of years, the prosperity of the colony must mainly depend on its herds and flocks.

While private speculators have thus been obliged to alter their views, the public affairs of the colony have been so mismanaged, or at least the previous calculations of expense have been so much exceeded, that the Commissioners have been obliged, after expending all the money that has come into their hands, to apply to Government for pecuniary assistance, which has been given them by a vote of credit for £155,000.

The greater part of the province is still unexplored, and it is only of the south-eastern portion, along the coasts of Spencer's and St. Vincent's Gulfs and Encounter Bay, that any thing is known. The first settlements were formed in December 1836, on the east side of the Gulf of St. Vincent, about fifty miles from the ocean, and the city of Adelaide founded there, in one of the most singularly unfortunate spots, we believe, ever selected for the site of a capital. It is six miles from the sea, on the banks of an unnavigable river, which has been very appropriately named the Torrens, for it is in fact a torrent, with a continuous stream in winter, but presents in summer only a chain of pools, and terminates before reaching the sea, in a marshy flat named the Reed Beds. The town and neighbouring country were laid out in sections; speculation in lots rose to a perfect mania; the most extravagant prices were given for building ground; for a time the new city made the most rapid progress, being supported by the continual influx of immigrants; and the population soon exceeded 6000 inhabitants. But the tide of immigration has been diverted to the more eligible station of Port Lincoln, on the south-western shore of Spencer's Gulf, which will now probably become the centre of South Australian colonization, while Adelaide, from its disadvantageous situation, with no intrinsic recommendations to support it, will consequently decline, or at best remain stationary.

The two gulfs already mentioned form very deep indentations in the southern coast, and are separated from each other only by a long, narrow, and barren jutland,

named York Peninsula, which terminates with Cape Spencer. Between the Gulf of St. Vincent, and the Lake Alexandrina and the lower Murray, there is another peninsula terminating with Cape Jervis, and intersected by three great mountain masses, named the *Mount Lofty*, *Mount Barker* or *Great Ironstone*, and *Mount Wakefield* ranges, which form among them table-lands and valleys of considerable elevation, presenting a beautifully undulating and lightly wooded country. But in some places there are sharp precipitous ridges, rising from 1800 to 2000 feet. This tract is roughly estimated to consist of one-third of sandy soil adapted for agriculture or pasturage, one-third of stringy-bark forest, and the remaining one-third is covered with brushwood or rock, which might perhaps be suitable for the vine. From the vicinity of Adelaide, a range of barren heights extends northward along the eastern side of both gulfs, rising in some places to a considerable elevation, and terminating, in 29° 20′ S., with Flinders' range, which is inclosed in a peninsula formed by one of the most singular lakes yet known. This lake commences not far from the head of Spencer's Gulf, takes a circuitous course of fully 400 miles, with an apparent breadth of from 20 to 30 miles, following the sweep of Flinders' range, and nearly encircling it in the form of a horse-shoe. The greater part, however, of the vast area contained in its bed is, or at least at the time of the discovery was, dry on the surface, and consisted of a mixture of sand and mud of so soft and yielding a character as to render perfectly ineffectual all attempts to cross it, so as to reach the edge of the water, which appeared to be at the distance of two or three miles. It was discovered by Mr. Espy in 1840; but on one occasion only was he able to reach and taste the water, which proved to be as salt as that of the sea. The lake, on its eastern and southern sides, is bounded by a high sandy ridge, with salsolæ and some brushwood growing on it, but without any other vegetation. The other shores presented, as far as the discoverer could judge, a very similar appearance; and on ascending several of the heights in Flinders' range, from which the views are very extensive, and the opposite shores of the lake distinctly visible, no rise or hill of any kind could be perceived, to the west, north, or east. The whole region appeared to be one vast, low, and dreary waste. He named it *Lake Torrens*, in honour of Colonel Torrens, the great promoter of the colony. The greater part of the country traversed by Mr. Eyre in this expedition, was dreary and impracticable, generally level, without trees or grass, and held out no inducements for the extension of settlements in that direction.

The best and most fertile portion of the colony seems to be that to the east of Adelaide, between the Gulf of St. Vincent and Lake Alexandrina, where several portions of rich soil have been found interspersed amidst extensive tracts fit only for pasturage. The whole of it, however, is beautiful in appearance, very moderately wooded, principally with oaks and mimosas, and contains abundance of emus and kangaroos. The banks of the Murray afford an inexhaustible supply of wood for fuel; but no coal has yet been discovered in the province. *Lake Alexandrina* is a large expanse of water, 50 miles in length, by 20 or 30 in breadth, formed by the river Murray, the free outlet of which has been dammed up by a sandy ridge, which extends along the shore of Encounter Bay. The lake is partly fresh, partly brackish, and partly salt, and has a depth of only four feet, with a bottom of mud; the eastern part of it forms a distinct basin about 50 miles in circumference, which has been named *Lake Albert*, and is surrounded by a fine country. The south side, however, of Lake Alexandrina is not one continuous ridge of land; it consists of several islands, the largest of which is skirted on the east by Sturt's boat channel, while the main channel or outlet of the lake runs close into the mainland to the westward of the island for a space of 16 miles, and joins Sturt's outlet at the distance of less than a mile from the sand-hills on the coast. This channel forms a noble stream, with a width varying from 500 yards to a mile and a-half, and a depth of from 4 to 10 fathoms. On its western bank are several fine fresh-water inlets, with deep water, forming so many natural and ready made wharfs. In September 1840, a navigable channel, from the sea into this river, was discovered by Mr. Pullen, the colonial marine surveyor, containing a depth of 12 or 13 feet over the bar at high water, but surrounded by shoals and breakers. The governor has given it the name of *Port Pullen*; and there is every reason to think that in moderate weather steamers, and in leading winds sailing vessels, of six feet draught of water or under, may with safety run into the Murray; while in rough weather there will be shelter for such vessels at *Rosetta Cove*, *Victor Harbour*, and *Freeman's Nob*, from 9 to 14 miles distant. The country to the eastward, along the coast, forms a low and sandy shore.

The *City of Adelaide* is built on two limestone heights, on the opposite banks of a chain of pools named the Torrens, in a bare sandy tract, six miles from the sea, and about four miles from the Mount

Lofty range of hills. It consists of two towns, laid out in regular streets, but the houses are built of every kind of material, from the humble mud hut to the neat brick building with plastered front. A spacious government house has also been erected at the cost of £15,000! The only supply of good water is from very deep wells dug with great labour and expense in the sandy soil, the water of the Torrens being bad and unwholesome. The city has two ports on the east side of St. Vincent's Gulf. The one, named *Port Adelaide*, 7 miles north-west of the city, is a muddy salt-water creek about seven miles in length, and about 70 yards wide at the entrance, with two bars, over which there are 10 or 12 feet of water in ordinary tides. The country around is low and swampy, frequently overflooded, affording little or no shelter for the shipping; and vessels cannot put to sea out of it without a fair wind, the channel being so very narrow as to prevent the possibility of working to windward. Great exertions, however, are making to improve it; and a railroad to connect it with the city is in contemplation. The houses at the port are built on a glaring and loose sand-hill. The other port, named *Glenelg*, is about the same distance to the south-west of Adelaide, also at the entrance of a creek, which is the occasional mouth of the Torrens, when it has water enough to reach the sea. Ships anchor in Holdfast Bay, an open roadstead, quite exposed to the south-westerly gales, which cause a tremendous sea to run into it; and for nine months in the year the wind is from that quarter.

Port Lincoln is a magnificent harbour, or rather a series of three harbours, with two entrances formed by Boston Island, but nevertheless mostly land-locked. It is of a semicircular form, almost surrounded by hills wooded to the water's edge, sufficiently high to be picturesque, but neither so high nor so steep as to form a barrier to the interior. Deep water close in shore washes a beach of gravel or stones, except on the south side, where for a short space it is sandy and comparatively shallow. The hills are generally of one character, open she-oak forest somewhat stunted rising from a soil six or eight inches in depth, over a stratum of limestone. Some of the hills, however, are barren, and covered with granite or ironstone; but most of them have sufficient grass for pasturing sheep, while the valleys might support a limited number of cattle, or partly admit of cultivation. The scenery is splendid, but the country beyond, and towards the interior, seems not to be very inviting in point of fertility and adaptation for culture. Nearly opposite Port Lincoln, on the eastern shore of Spencer's Gulf, is an available harbour named *Port Victoria*; and on the eastern side of York Peninsula, nearly in the latitude of Port Adelaide, is a safe and commodious anchorage, which has been named *Port St. Vincent*.

§ 3. *Western Australia.*

This province lies between 31° and 35° S. lat., and 115° and 129° E. long.; is the south-western corner of Australia. The distinguishing features of the territory are three distinct parallel ranges of primitive mountains bordering on the sea coast in the direction of north and south. The highest and most easterly range terminates near King George's Sound; the second, named the Darling Range, passes behind the Swan River, and terminates with Cape Chatham; the third and lowest range extends from Cape Leeuwin to Cape Naturaliste; but 300 miles farther north, another range appears on the coast in the same line of direction, and is probably a continuation of the same formation. Indeed both the soil and the climate are much the same as in the other parts of Southern Australia, the country being generally better adapted for pasturage than for agriculture. So far as it has yet been occupied, the territory appears to rest on a granitic basis, and the soil is very thin. The wet season commences in April with slight showers, which continue to increase in number and force throughout May, June, and July; after which they begin to decrease, until they cease altogether in November, when the dry weather begins. These two seasons, with an intermediate spring following the conclusion of each, embrace the circle of the year. The wet season is usually called the winter, and the dry season the summer; but neither of them has the character of the corresponding season in Europe. The prevailing wind at sea, off Cape Leeuwin, is westerly throughout the year; but on the coasts, during summer, there is a regular daily alternation of land and sea breezes. In winter, gales from the north-west and south-west are very frequent, and are usually accompanied by heavy falls of rain. In summer the atmosphere retains so little moisture, that none but hardy and fibrous plants can withstand the drought; the atmosphere is then so clear, and the reflection of the sun so great, that the thermometer, in the shade and near the ground, sometimes reaches 105°. The hottest months are January, February, and March; but the evenings and mornings are generally cool and pleasant; the mid-day heats are tempered by a refreshing sea-breeze from the south-west; and a land breeze from the east prevails in the morning. Slight fogs occasionally hang over the rivers, and a refreshing dew falls at night; but as there are no considerable marshes, the country is free from malaria and noxious vapours. The winter months are June, July, and August; the two latter of which are the most rainy. There are sometimes smart frosts, and now and then a little ice; but all traces of them disappear at sunrise. Hailstones of very large size occasionally fall; but snow is unknown. The greater part, however, of the winter is remarkably temperate and fine, but the changes of temperature are often sudden; and during the rest of the year nothing can be more delightful than the climate generally, and its invigorating influence on the human constitution renders it very suitable for invalids. The principal diseases are rheumatism, dysentery, scurvy, and catarrh, in winter; and, in summer and autumn, a kind of subacute purulent ophthalmia, which is endemic, and is the only disease that can be strictly so considered. Cases of fever are seldom met with. The average mean temperature of the year is from 60° to 64°; the seasons have hitherto been found to return steadily

and uniformly; and the agriculturist is enabled to carry on his operations with less interuption than in any other part of the world. All kinds of domestic animals generally thrive well; but sheep and cattle are sometimes attacked with a disease which carries them off in a few minutes. The disease has chiefly appeared in flocks recently imported and in feeble condition, and in cattle engaged in long joufneys in the bush, where the food is scrubby and coarse. Flocks kept on low damp ground near the coast, or in high scrubby ground destitute of healthy grass, or in passing the Darling range into the interior through a scrubby country, have too been generally affected. Horses are fed on the same ground without the smallest injury.

This colony was established in 1829. The settlers at first met with many difficulties and discouragements; the land near the coast was found to be poor and sandy; but, subsequently, on exploring the interior, fine pastoral and agricultural tracts have been discovered; the gradual introduction and multiplication of sheep and cattle, has begun to enrich the settlers; and the colony is at last, though slowly, beginning to prosper. At the end of 1829, the number of residents in the colony was 850; in 1839, the number had increased only to 2154, of whom 1302 were males, and 852 females. The colony has a lieutenant-governor, and a legislative council appointed by the Crown; but the laws are still strictly those of England, so far as they are applicable to the circumstances of the country. The territory has been divided into fourteen counties, named *Twiss*, *Perth*, *York*, *Murray*, *Grantham*, *Wellington*, *Wicklow*, *Sussex*, *Nelson*, *Lanark*, *Goderich*, *Stirling*, *Hay*, and *Plantagenet*; but these are far from being generally occupied. The principal part of the colonists were established on the *Swan river*, a considerable stream which flows into Cockburn Sound, on the west coast; the remainder are settled at *King George's Sound*, on the south-east coast; and it is principally from these two points that the settlements are extending. A company has been formed in London for the purpose of establishing a new colony at *Port Leschenault*, on the coast of the Baie du Geographe, in Wellington county, about midway between the two older settlements; to which the name of *Australind* has been given. The principal towns are *Perth* and *Freemantle* on the Swan river, and *Albany* on King George's Sound.

§ 4. *North Australia.*

This province forms the most northern part of the continent, and extends westward from the Gulf of Carpentaria, corresponding with the Arnheim's Land of the Dutch navigators. The only settlement yet established is at *Port Essington*, a deep indentation on the north side of Cobourg Peninsula, where a new town named *Victoria* was founded in 1838. The harbour is a splendid one; the deep-water anchorage under Point Record would contain twenty-five sail of the line; and in and about the anchorage off Victoria 500 sail of merchant-men might lie. The outer anchorage or roads is capable of containing the whole British navy.

North Australia is within the range of the Indian monsoons, of which the north-west usually sets in about the beginning of November, and that from the south-east in the early part of April; but they sometimes vary a whole month in the periods of their recurrence. The average annual temperature at Melville island, to the westward of the peninsula, is about 83°; the average winter temperature, 80°; of summer, 86°; and the extremes are 75° and 87°. During the rainy season in the first year of the settlement, the heat was oppressive; very little rain fell, and the thermometer on shore in the tents seldom fell, during the day, below 95°; it generally stood at 100°. On board it varied from 80° to 90°. The nights on shore were, however, comparatively cool, no cases of sickness occurred, with the exception of extreme annoyance from musquitoes and sand flies the climate proved most healthy. A south wind from the interior raises the temperature with extreme suddenness. The summer monsoon is attended with very heavy falls of rain; but these seldom continue above two or three hours at a time. From June till September no rain falls; a great quantity of moisture must nevertheless be always suspended in the atmosphere, even during the prevalence of the dry or south-east monsoon; for iron articles are kept from rusting only by incessant care; and the exposed surfaces of the rocks along the coasts, are so generally coloured by the oxide of iron, that they might, without impropriety, be described as red. Among the native fruits and plants have been found a species o nutmeg of fine flavour, and the cotton-tree; and there is no doubt that every kind of spice, with sugar, rice, and cotton, might be produced in this province.

Norfolk Island, 900 miles E.S.E. of Sydney, in 29° 1′ S. lat. and 168° 10′ E. long., contains about 11,000 acres of land, generally of a rich brown mould. It is extremely beautiful, affording fine tropical scenery of hill and dale. It produces the New Zealand flax of great size, and several cabbage palms;

but the most peculiar and valuable part of its vegetation is the magnificent araucaria excelsa, or Norfolk Island pine. In 1791 it was colonized by the government of New South Wales, for the purpose of raising supplies for that colony; but is now used as a prison exclusively for convicts, where they are to be subjected to a new plan of treatment introduced by Captain Maconochie, and which is expected to produce the best effects in reforming them, and fitting them to be restored as useful members to society. Between Norfolk Island and the coast of Australia there are several small islands and reefs scattered over the ocean. The principal of them are: *Lord Howe's Island; Seringapatam Island; Middleton's Island; Nelson Bank*, and *Solitary Isles*.

TASMANIA or VAN DIEMAN'S LAND.

SITUATION AND EXTENT.—Between 41° 20′ and 13° 40′ S. lat., and 144° 40′ and 148° 20′ E. long. The greatest extent from north to south is estimated at about 210 miles, and from east to west, about 150; the superficial area contains about 24,000 square English miles, or a little less than Ireland.

GENERAL ASPECT. — The face of the interior is very diversified, and decidedly mountainous. It consists, however, not of mountain ranges, but rather of isolated peaks, varied by lofty table-lands and extensive fertile valleys and plains. In the south, nothing can be more rude or bold than the general appearance of the landscape; hills rising above hills, all thickly covered with trees, with here and there a majestic rocky eminence towering aloft, form the prospect. On proceeding into the interior, the country loses much of its stern and forbidding aspect; there many fine open spots are found very lightly timbered, and extending in some instances for several miles, but always locked by mountains. Near the middle of the island there are beautiful plains, intersected in some places by streams, and extending as far as the eye can reach; and, on proceeding northward, every diversity of hill and dale, woodland and plain, forest and tillage, enlivens the scene. The western portions have as yet been but imperfectly explored; but they are represented as generally bold and mountainous, although possessing well watered and fertile spots. Much of the land in that direction, as well as that towards the east coast, lies high and exposed.

MOUNTAINS. — There are several mountains of great elevation. *Mount Wellington* or *Table Mountain* rises 3795 feet above the level of the sea, behind Hobart-town. It has a bold and rugged aspect and is snowcapt for eight months of the year, but is seldom obscured by clouds. The mountains on the south-west coast, near Port Davey, are still higher, and are snowcapt for a great part of the year. They form a long mass stretching inward for several miles, and rise in some places 5000 feet. The hilly character, indeed, of the southern side of the island is but little interrupted, the hills being not only frequent but continuous. Some of the principal masses have been named: Mount *Direction*, *Frankland Hills*, *Arthur Hills*, the *Hartz Mountains*, *Adamson Peak*, *Mount De Witt*, all in the south-west, between Port Macquarrie and Storm Bay. In the north-east, *Benlomond* rises 4200 feet. The *Table Mountain*, in Tunbridge county, near the centre of the island, rises 3800 feet; the *Peak of Teneriffe* or *Wylde's Craig*, 65 miles N.W. of Hobart-town, 4500; *Quamby's Bluff*, south-west of Launceston, 3500; *Mount Field*, 3000; *St. Paul's Dome*, 42 miles S.E. of Launceston, 2500.

RIVERS AND LAKES. —The *Derwent* issues from *Lake St. Clare*, which is 10 miles in length by 3 in breadth, 70 miles N. of Hobart-town, and flows to the south-east, where it forms a noble estuary, terminating in Storm Bay. It varies in width from its entrance to Hobart-town from 6 to 12 miles, having every where deep water, without rocks or sandbanks, and is navigable at all seasons with perfect ease and safety. Its principal affluents are: the *Nive*, the *Dee* from *Echo Lake*, a small circular basin; the *Ouse*, joined by the *Shannon* from the *Clarence* or *Great Lake*, a large and beautiful mass of water in Westmoreland county, about 150 miles in circumference, following the winding of its shore; the *Clyde* from *Crescent Lake* at the foot of Table Mountain; the *Jordan* from *Lake Tiberias* in Monmouth county, 30 miles N. of Hobart-town; all on the left. On the right it receives no important affluent, that side of its bed being bordered by a continuous series of hills, which pour down only small streams, with short and rapid courses.

The *Huon* flows from *Peder Lake*, at the foot of the Frankland hills, and forms a fine estuary which opens into D'Entrecasteaux channel, south-west of Hobart-town.

The *Tamar* is a long estuary formed by the junction of the *North Esk* and the *South Esk*, at Launceston, and extending northward to Bass's Strait. It is navigable to Launceston, but requires great skill and management to take up or down large vessels with safety, on account of a bar and other intricacies. The *North Esk* and the *South Esk* have their sources in the hill country eastward of Launceston. The principal affluent of the latter is the *Macquarrie* from the *Nineteen Lagoons* in Somerset county.

Along the north coast are: *Piper's River*, to the east of the Tamar, the *Rubicon*, *Mersey*, *Don*, *Forth*, *Leven*, *Blythe*, *Emu*, *Cam*, *Trut*, *Duck*, *Montague*, *Welcome*, all to the west. On the west coast: the *Arthur* and *Hellyer*; *Pedder*; *King's River*; the *Gordon*, which runs into Macquarrie Harbour; the *Davey*. On the east coast is the *Prosser*. Besides the lakes already mentioned, there are *Lake Sorell*, a large round basin, near the middle of the island; *Arthur Lakes*, two large masses of water a little to the north-west of Lake Sorell, and which are connected by running streams with each other and with *Wood Lake*, a small basin to the south; their outlet is *Lake River*, an affluent of the Macquarrie; *Petrarch Lake*, whose outlet, the river *Curier*, flows to Lake St. Clare; *Edgar Lake*, whose outlet is one of the feeders of the Huon river.

BAYS, GULFS, &c.—Besides the estuaries of the Derwent and the Tamar, there are numerous other bays and harbours which afford secure anchorage. *Storm Bay* is a large open gulf on the south-east coast, between Tasman Peninsula and Brune Island. It terminates inland with the *Derwent*. *Frederick Henry's Bay*, and *Norfolk Bay* or *Port Buache*. Inside of the Derwent is a land-locked gulf named *Ralph Bay*. *D'Entrecasteaux Channel* extends upwards of 40 miles in length, between the main land on the west, and Brune Island on the east side, which divides it from Storm Bay. It forms a navigable passage to the Derwent, with the mouth of which it communicates by a narrow strait. On its west side are the estuary of the *Huon* and *Swan-Port*, *Esperance Bay* or *Adamson's Harbour*; *Seal-Port* or *Muscle Bay*, and *Recherche Bay*. On the east side of Brune Island is *Adventure Bay*, a large open gulf; and, at its south end, *Bad Bay*. On the west side of Tasman's Peninsula is *Wedge Bay*.

on the south side, *Port Arthur*, the penal station of the colony; on the east side, *Fortescue Bay*, and *Monge* or *Pirate's Bay*. Farther north, and along the east coast of the island, are: *Frederick Hendrick's Bay*, *Marion Bay*, *Prosser's Bay*, *Spring Bay* or *Port Monbasin*, *Grindstone Bay*, *Little Swan-Port*, *Oyster Bay*, a large open gulf between the mainland and a long peninsula terminating with *Geographe Strait*, which divides it from Schouten island; the *Great Swan-Port*, at the head of Oyster Bay; *Thouin Bay*, on the east or outside of the peninsula; *George Bay*, *Anson Bay*, a river. On the north coast: *Ringarooma Bay*, *Port Dalrymple*, the mouth of the Tamar; *Port Sorrel*, *Port Frederick*, *Emu Bay*, *Freestone Cove*, *Pebbly Bay*, *East Bay*, and *West Bay*, on the opposite sides of the isthmus of Circular Head; and *Duck Bay*. On the west coast: *Studland Bay*, *Macquarrie Harbour*, a large land-locked basin, 22 miles in length, and from five to seven in breadth, with a narrow entrance to the north-west; *Port Davey*, a deep indentation of the south-west coast, with *Cockburn Cove* on the one side, and *Bathurst Harbour* on the other.

ISLANDS, ROCKS, PENINSULAS.—*Bruné* or *Bruni Island*, between Storm Bay and D'Entrecasteaux Channel is 35 miles in length, but very narrow, and consists of two peninsulas joined by a very narrow isthmus. *Betsy Island*, and *Ironpot Island*, two islets near the mouth of the Derwent. *Tasman's Peninsula*, 27 miles in length by 16 in breadth, on the east side of Storm Bay, is connected by a narrow isthmus with a smaller peninsula named *Forrestier*. This peninsula is now the penal station of the colony; the principal settlement of which is at Port Arthur; and a strong military guard is kept at the isthmus which connects Forrestier with the mainland. Off the south-east point of Tasman's Peninsula is the small island named *Tasman's Island* or *The Pillar*. *Maria Island*, on the east coast, 13 miles long, consists of two peninsulas, in the most northerly of which is a mountain mass, named the Bishop and Clerk, rising 3000 feet above the level of the sea. Off the north point is the *Isle du Nord*, or *Green Island*; and between Maria Island and the mainland, is *Lachlan* or *Middle Island*. *Schouten Island*, at the south-east side of Oyster Bay. Off its south point is *Taillifer Island*; and opposite the mouth of Oyster Bay is the *White Rock* or *Seal Island*. *King George's Rocks*, *Black Rocks*, *Swan Isles*, *Furneaux's Islands*, and *Kent's Islands*, lie off the north-east coast, in Bass's Straits. The largest of Furneaux's Islands, named *Flinders* or *Great Island*, is now the abode of the small remnant of the natives of Van Dieman's Land, who have been transported to it by the Colonial government. *Waterhouse Island* and *Little Island*, on the west side of Ringarooma Bay. *Hebe Reef*, at the mouth of Port Dalrymple. *Circular Head*, a peninsula projecting 7 miles, near the west end of the north coast. *Hunter Islands*, a group of large islands off the north-west point of Van Dieman's Land; and named *Barren Island*, *Albatross Island*, *Three Hummock Island*, *Walker's Island*, *Robbin Island*, *Perkin's Island*, *Petrel Isles*, *Penguin Island*, *Stack Island*, *Harbour Island*, *Long Island*, *Short Island*, *Trefoil Island*, *Sheephead Island*, *Black Rock*, &c. *King's Island*, a large island in the middle of the western part of Bass's Strait. *Pyramid Island*, on the north side of Point Hibbs, on the west coast. *De Witt's* or *Maatsuiken Islands*, *Needle Rock*, and *Isle du Gotte*, on the south coast, between South Cape and South-west Cape.

CAPES.—On the north coast: *Circular Head*, a mass of basalt, exactly resembling a huge round tower or fortress; *Rocky Cape*, *Table Cape*, *Westhead* of Port Sorell, *Point Flinders*, *Five-mile Bluff*, *Stoney Head*, *Double Sandy Point*, *Waterhouse Point*, and *Cape Portland*. On the east coast: *Eddystone Point*, *Grant's Point* and *St. Helen's Point*, both at the entrance of George River; *Cape Lodi*, *Cape Tourville*, *Cape Forrestier*, *Cape Degerando*, and *Cape Sonnerat*, on the east, outside of Oyster Bay; *Cape Bailli*, *Cape Bougainville*, *Cape Bernier*, *Cape Frederick Hendrick*, *Cape Surville*, *Cape Peton*, the most southerly point of Maria Island; *Cape Pillar*, the south-east, and *Cape Raoul*, the south-west point of Tasman's Peninsula; *Cape Frederick Hendrick*, *Fluted Cape*, a beautiful mass of basaltic columns, which rise like the barrels of an organ, and *Tasman Head*, on the east side of Bruné Island; *Cape Bruné*, the south-west point of the same island. On the south coast: *Whale Head*, *South Cape*, and *South-west Cape*. On the west coast: *Cape Grim*, *Green Point*, *West Point*, *Bluff Point*, *Ordnance Point*, *Sandy Cape*, *Cape Sorrel*, at the entrance of Macquarrie Harbour, *Point Hibbs*, *High Rocks*, two peninsular promontories, and *Rocky Point*.

GEOLOGY, &c.—Trap is believed to form the principal substratum of the island. All along the coast it presents itself in precipitous rocky heights standing on beautiful columnar pedestals; and, in the interior, Mount Wellington, the Western Table Mountain, and the precipitous banks of many of the mountain streams are composed of it. In some places the columns appear in isolated masses, springing up at once from the surface, like obelisks or huge needles, and present a very singular appearance. Argil appears in the form of excellent roofing slate; and in the form of mica it is found in large masses on the rocks around Port Davey, where it is so much worn by the weather as to assume the appearance of snow. Excellent sandstone for building is found in almost every part of the island; flints in great plenty are scattered on the hills; and other species of silicious matter are found in various places, as hornstone, schistus, wood-opal, bloodstone, jasper, and cat's-eye. Limestone and marble likewise abound, and indications of coal have been found all across the island, from South Cape northward by Hobart-town, Coal River, Jerusalem, Jericho, and other places. Iron ore is also very generally diffused, some of which affords 80 per cent. of the metal; specimens of red and green copper ore, lead, zinc, manganese, and, as some say, of silver and gold, have occasionally been met with. Fossil vegetable remains, entirely converted into silicious matter, and capable of the finest polish, are occasionally found in different places, and we have seen specimens of wood converted into a sort of ironstone, from the bed of the Tamar. The soil is very various; being in some places a rich black alluvial mould, in others, sandy or argillaceous. It produces excellent crops, and may be cultivated for a succession of years without rest or manure.

CLIMATE.—Making allowance for the higher southern latitude, and the greater coolness and humidity arising from its insular position, the climate of Van Dieman's Land is not very different from that of the settled maritime parts of New South Wales. Generally speaking, throughout the summer the atmosphere is cooled by alternate land and sea breezes, the influence of the latter of which is felt at the

distance of many miles from the shore. The average height of the thermometer is 70°, though it occasionally rises to 100°, or even 110°, when a parching hot wind blows from the north or north-west; but this high temperature seldom lasts long, and the rain which always follows it, soon cools the atmosphere. Thunder storms are not frequent, and are never violent. September, October, and November form the spring, when the weather is usually bright and clear, but with occasional rain and high winds. The thermometer during these months has an average range from 50° to 60°. December, January, and February, are the summer months. In general very little rain falls during this season, and the vegetable productions of the earth arrive at maturity about a month earlier than in England. March, April, and May are the autumn, and by far the most pleasant season. The atmosphere is then clear and bright; and the sky is free from clouds and vapours. The average heat is about 65°, and the nights are cool and refreshing. June, July, and August form the winter. In the interior, particularly on high and exposed situations, frosts are sometimes severe; and a good deal of snow falls, but it never lies throughout the day. The winter, indeed, is contemplated by the colonists as a season of moderate and genial rain, which prepares the earth for the ensuing spring, rather than as the cold and dismal season of higher latitudes. The average range of the thermometer is from 40° to 48°; but it sometimes falls for a day or two several degrees lower. The seasons, however, appear to undergo a change every nine or ten years, but varying in intensity every third series or thirty years. But, as a general rule, it may be affirmed that the atmosphere is extremely dry and elastic, and contains a greater proportion of oxygen than in most countries of the old world. It is in consequence very salubrious and fecundating to both animal and vegetable life. In 1839–40, however, the colony was visited by a virulent typhoid fever, which seems to have originated in the gaols.

VEGETABLE PRODUCTIONS.—The vegetable productions are much the same as in the contiguous portions of New South Wales. In many parts of the island there is no underwood; only scattered trees are found shooting up to a great height. Much of the timber is very serviceable, particularly the stringy-bark, gum-trees of several sorts, peppermint wood for building; huon-pine, black and silver mimosas, pencil cedar, and sassafras for interior fittings and cabinet-making. Among the ornamental woods are light-wood, she-oak or beef-tree, honey-suckle, myrtle, and the cherry-tree. All the trees are evergreens, and some of them, particularly the mimosas, put forth very rich blossoms in spring. The foliage, however, is generally dark or sombre green, without any of the agreeable variety presented by forests of deciduous trees. The species and varieties of shrubs and plants are numerous and beautiful; and among the most valuable yet discovered in the island may be enumerated the pepper-tree, the bark of which has been proved to possess many valuable medicinal qualities; and the tea-tree, the leaves of which serve as a substitute for the tea of China. All the cerealia, and every sort of fruit, herb, or vegetable that grows in England thrives equally well in Van Dieman's Land. The vine also arrives at perfection in favourable situations, particularly in the northern districts; and a good imitation of hock is produced in the neighbourhood of Launceston.

ANIMALS.—These also are much the same as in New South Wales. There are three species of kangaroo, differing principally in size; the hyæna-opposum or tiger, which is very destructive to the flocks; and another animal called the devil, of the same species, which is extremely ugly, untameable, and also destructive to the flocks. There are also porcupines, wombats, duck-bills, and wild cats, which destroy the poultry and young lambs; kangaroo rats and mice, opposums of several sorts, and bandicootes, which prey on the potatoe crops. The birds are of various species, and many of them of beautiful plumage; as emus, cocatoos, parrots, parroquets, magpies, the laughing jackass, eagles, hawks, kites, ravens, and crows; gulls, pelicans, king-fishers, black-swans, wild ducks, musk ducks, teal, widgeon, quails, snipes, a species of pigeon of a splendid bronze colour, in flavour resembling a partridge, besides many others. There are several kinds of snakes, some of which are extremely venomous; guanas, lizards, centipedes, scorpions, tarantulas; many curious and beautiful beetles; three or four species of ants, some of which are an inch in length, and sting sharply; various sorts of spiders and musquitoes, and a numerous tribe of the insects which are common in all countries. European domestic animals all thrive well and increase in size; among them are European rats and mice, which have been unwittingly imported with other live stock, and have found their way to all parts of the colony. The inlets and bays around the island swarm with fish, as salmon, perch, rock-cod, bream, mullet, whitings, flatheads, leather-jackets, taylors, parrots, guard-fish, cray-fish, oysters, eels

skate, and shrimps; one of the most admired fish is called the trumpeter. The lakes and rivers abound with very fine eels; but other freshwater fish are of little note, except the mullet, of which considerable quantities are caught near the falls at New Norfolk. A sea-fish supposed to be a species of toad, and found on the coast, is strongly poisonous. The black whale, during the breeding season, resorts to the deep estuaries, bays, and inlets, and forms a profitable object of pursuit.

PEOPLE.—The aborigines belong to the Ethiopic class, and differ but little from those of Australia, with this exception that they have woolly hair, a perfectly black complexion, with the face and general appearance more nearly resembling those of the African negro. With respect, however, to mental capacity, they are considered to be inferior even to the Australians. They are now very few in number, and the race will probably soon become extinct. The European settlers consist partly of convicts and emancipists, and partly of free settlers, who have been rapidly pouring into the island during the last five-and-twenty years. The free population, in 1824, amounted to 3781 males and 2248 females; in 1838, to 14,692 males and 11,363 females. The number of convicts, in 1824, was 5467 males and 471 females; in 1838, 16,069 males and 2064 females. The military and their families, in 1824, amounted to 266 males and 70 females; in 1838, to 1171 males and 405 females. Total population in 1824, 12,643; in 1838, including aborigines, 45,846. Of the free population, in 1838, 16,094 were classed as belonging to the Church of England; 2551, to the Church of Scotland; 2288 Catholics; 1289 Wesleyan Methodists; 635 Independents; 175 Baptists; 132 Jews; and 80 Quakers. The educated British convicts are now all sent to Port Arthur, on Tasman's Peninsula; young male convicts are also sent there, and placed under teachers qualified to make them useful in several trades; colonial convicts, and prisoners re-convicted, are likewise removed to this great Penitentiary, where they are employed in felling, sawing, cutting, splitting, and loading timber; in building ships, prisons, barracks, &c.; shoemaking, tanning, and in various other ways. They are all subjected to the severest discipline and privations, the tendency of which is utterly to demoralize them, and make them recklessly ferocious. Hence murders among them are of frequent occurrence, without premeditation or cause.

GOVERNMENT.—The Government is precisely similar to that of New South Wales. The chief authority is vested in a lieutenant-governor and executive council, and in a legislative council. There is a supreme court of law with a chief judge and two puisne judges at Hobart-town; but the judges also hold circuit courts in other places.

PRODUCTIVE INDUSTRY.—About two-thirds of the population are employed in agriculture, or dependent on it; about one-third is engaged in commerce; and one-eighth, in arts and manufactures. In 1838, the total quantity of land in crop amounted to 96,639 acres, whereof 41,796 were wheat; 13,525, barley; 21,660, oats; 870, pease; 127, beans; 3548, potatoes; 9164, turnips; 17,760, English grasses; 443, tares. The produce in that year amounted to 551,285 bushels of wheat; 183,604 of barley; 251,491 of oats; 12,460 of pease; 1031 of beans; 11,533 tons of potatoes; 12,396 tons of turnips; and 15,992 tons of hay. The amount of stock, in 1828, was: horses, 2034; cattle, 84,476; sheep, 553,698; goats, 708. In 1838, horses, 9884; cattle, 77,153; sheep, 1,222,511; goats, 2624. The arts and manufactures are various but unimportant in amount, being chiefly confined to such articles as are of immediate necessity, or such as cannot bear the expense of importation, or cannot be conveniently exercised any where else, as brewing, printing, mills, tanning, &c.

The commerce consists in exporting the raw produce of the island, and importing the manufactured produce of other countries. The total value of both branches of trade, for the fifteen years from 1824 to 1838, are stated in the following table; together with the value of the two principal articles of export, whale oil and wool, and the amount of shipping and tonnage.

Year.	Value of Imports.	Value of Exports.	Vessels Inwards.		Vessels Outwards.		Value of Whale Oil Exported.	Value of Wool Exported.
			No.	Tonnage.	No.	Tonnage.		
1824	£62,000	£14,500	33	11,116	35	11,604	....	....
1825	88,161	23,837	52	13,455	54	12,435	....	....
1826	99,747	44,498	54	12,184	56	12,523	....	....
1827	152,627	59,902	97	18,893	91	16,004	....	....
1828	241,382	91,461	131	23,741	133	24,116	....	....
1829	272,189	126,984	110	24,717	111	25,742	....	....
1830	255,298	145,980	101	26,582	92	25,045	....	....
1831	298,774	141,745	94	23,184	102	25,451	....	....
1832	392,666	157,906	142	31,724	128	28,019	....	....
1833	352,894	152,967	167	37,442	159	36,250	....	....
1834	476,617	203,522	150	33,441	134	32,192	....	....
1835	583,646	320,679	234	55,833	225	53,560	£51,398	£142,921
1836	558,340	420,123	292	58,142	274	52,780	52,960	171,009
1837	563,144	540,221	344	60,960	363	57,945	68,757	220,739
1838	702,956	581,475	370	64,454	369	63,392	121,270	171,899

The circulating medium consists partly of specie and partly of the notes of the Derwent, Van Dieman's Land, Commercial, Union, Tamar, and Australasian, banks. The estimated amount of coin in circulation, in 1838, was £136,000; of bank-notes, £54,557.

DIVISIONS.—The settlements of the colonists extend chiefly through the middle of the island, from Port Dalrymple to Storm Bay; few have yet extended towards the east coast, and fewer still, if any, into the western districts. The middle and eastern portions of the island have been divided into the counties of *Kent*, *Buckingham*, *Monmouth*, *Pembroke*, *Glamorgan*, *Somerset*, *Cumberland*, *Westmoreland*, *Devon*, *Dorset*, and *Cornwall*; and these already are, or are intended to be, subdivided into hundreds and parishes.

TOWNS.—HOBART-TOWN, the capital, is a large, and in many parts, a neatly built town, on Sullivan's cove, on the right bank of the Derwent, about 20 miles from Storm Bay. The public buildings are numerous, and some of them commodious and handsome. There is only one English episcopal church; but there are several places of worship for other denominations, and the number is regularly increasing. The manufactories of the town consist of distilleries, breweries, tanneries, timber and flour mills, soapworks, and candleworks, &c. Around the town there are handsome villas and enclosures in every direction; and along the water's edge a noble wharf has been constructed, so as to allow vessels of the largest burden to lade or unlade close alongside. Hobart-town was founded in 1804. The population of the town and district in 1838 amounted to 14,382. Three miles north, on the main road to Launceston, is the pretty village of *Newtown*, remarkable for its elegant and picturesque villas, its race-course, gardens, fine fruit, and bay.

Launceston, 121 miles N. of Hobart-Town, and connected with it by a good road, is situate on a flat of the richest land in the island, backed by gently rising hills, at the confluence of the North Esk and South Esk rivers, which there form the Tamar, 45 miles from its mouth in Bass's Strait. It is a very thriving town, being the centre and the shipping port of a well-inhabited district; vessels of 500 tons come up to the town, and load and unload along the wharfs: the population of the town and district in 1838 amounted to 6136. *Georgetown*, at the mouth of the Tamar, on the right bank, is also a thriving town, where many vessels stop rather than encounter the trouble and the risk of going up to Launceston. In the interior there are several thriving country towns, as *New Norfolk*, on the Derwent, 22 miles above Hobart-town; *Brighton*, and *Richmond*, to the north of Hobart-town, on the east of the river; *Hamilton*, *Bothwell*, and *Grantham*, on the Clyde; *Oatlands*, 40 miles north of Hobart-town, *Longford*, *Perth*, and *Campbelltown*, both to the south of Launceston; *Westbury* and *Deloraine*, both to the west of Launceston; and *Llewellin*, to the south-east on the South Esk.

NEW ZEALAND.

SITUATION AND EXTENT.—This group of islands is situate in the South Pacific Ocean, between 34° 25′ and 47° 19° S. lat., and 166° and 179° E. long., about 1400 miles S.E. of New South Wales. It consists of two large islands and one smaller one, which extend in a line from north to south, about 1100 miles, including the width of the straits which divide them; but the breadth is extremely rregular, varying from 5 miles to 200. Their total area is estimated by some to contain 87,400, and by others, 95,000 square miles, or 55,936,000 acres, two-thirds of which are considered to be capable of cultivation. The most northerly island, named *Eaheinomawe*, is 540 miles in length; but the northern half of it consists of an extremely irregular series of peninsulas, no where exceeding the breadth of 50 miles, while some of the isthmuses are less than five, and one of them is only three miles across. The southern portion is more compact; its smallest breadth being 50 miles, and its greatest, about 200. The southern large island, named *Tavai-Poenamoo*, is about the same length, but is of a more regular form, and varies in breadth from 50 miles to 150. The most southern or small island, named *Stewart's*, is of a compact roundish form, measuring about 50 miles by 40. The coast line, following the various indentations of the land, probably exceeds 3000 miles.

GENERAL ASPECT.—The two large islands are traversed from N.E. to S.W. by a range of lofty mountains, skirting the south-eastern coast of the Northern Island, and approaching the west coast of the Southern Island, which are intersected by beautiful valleys, and watered by fine rivers. In the Southern Island some of the mountains are said to be continually snow-capt, which, in this latitude, would infer an elevation equal to that of the Alps; but they have not yet been explored, nor has their elevation been accurately ascertained. There are likewise several subordinate ranges of hills, and a few detached outlying mountains of vast dimensions, as Mount Egmont on the west coast, and Mount Edgecumbe, on the Bay of Plenty, both of which are volcanic, and exceed the elevation of 10,000 feet. In the interior several volcanoes are said to be in active operation; and the sides of the mountains in which they are situate contain deep and frightful caverns. A few of the smaller mountains are barren, or clothed only with fern, but the greater number are covered with magnificent forests, containing trees of enormous size, and embracing a great variety of species. Between the mountains and the sea, on both sides, is an immense extent of forest, plain, and pasture land, which is almost every where accessible by means of numerous fine bays and navigable rivers. The coasts of the Northern Island, however, are bounded by a belt of sand hills, within which a series of low flat lands extends for many miles, covered in summer with a reedy vegetation, and, in wet weather, converted into swamps. This forms altogether a large extent of territory, and contains in many instances some of the most valuable land in the country, requiring only to be drained, and redeemed from its present state of uselessness. Seaward, the whole west coast is beset by rocks or shifting barriers of sand.

BAYS, GULFS, AND STRAITS.—On the east side of the Northern Island: *Sandy Bay; Nanga-Ounou Bay; Doubtless* or *Oudou-Oudou Bay; Wangaroa Bay*, lat. 35° S., a beautiful, romantic, and spacious basin, capable of containing the largest fleet, and affording good anchorage in from 5 to 11 fathoms, completely sheltered from the sea and all winds. The entrance is only 200 yards wide, but there are no hidden dangers, and there is good anchorage outside. The shores are steep, with sufficient depth of water for any vessel within a few yards of them. The *Bay of Islands*, 35° 10′ S., so named by Cook from the number of rocks with which it is studded, is nevertheless a remarkably fine and capacious harbour, and affords shelter in all seasons and in any weather. Its entrance is 11 miles wide; there is deep water close to the shore, and it branches into several fine harbours; the two which are most used by shipping are the *Bay of Kororarika* and the river *Kawa-kawa*. *Wangarura*, *Wangamuma*, and *Tutukaka*, are three harbours fit only for small vessels, between the Bay of Islands and *Wangari Bay*, which is an extensive roadstead protected from north to north-east by Bream Head, and with soundings from 6 to 10 fathoms. The *Gulf of Shouraka* or *Houraka* is an open roadstead, with an entrance 16 miles wide, open to the north, and terminating southwards in the estuary of the river Thames. It contains two fine harbours, *Kaihu* in the bay of *Mahurangi*, and *Waitemata*, which is separated only by a narrow isthmus from the port of Manukao or Manukou, on the west coast. *Witi-angi* or *Mercury Bay*, is situate on the eastern or outside of the peninsula of Shouraka, and has a rocky entrance of difficult ingress and egress. The *Bay of Plenty*, a wide expanse of 130 miles, open to the north, between Shouraka and Cape Runaway, contains the harbour of *Tauranga*, a few leagues to the south of Mercury Bay, which is resorted to by small craft, trading for flax. *Taone-roa* or *Poverty Bay*, on the south-east coast of the Northern Island, 38° 45′ S. is in the form of a half-moon, surrounded by a sandy beach. *Hawke's Bay*, 30 miles farther south, a large open, and unsheltered expanse, between 39° and 40° S. lat. *Cook's Strait* divides the two large islands; its western entrance is 98 miles across; its eastern about 48, and the middle, or narrowest part, is 12. A little way within its eastern entrance, on the north side, is *Wangeneatera Bay*, or *Port Nicholson*, which extends inward 12 or 14 miles, with a breadth of from 2 to 4, affording safe anchorage and complete shelter for any number of vessels, and containing room to beat out in any wind. It terminates with a large, broad, and deep river. *Palliser Bay*, to the south-west, terminates in a large lagoon. On the west coast of the Northern Island: *Wharo*, an open roadstead, about 20 miles S. of Cape Maria Van Dieman, with good anchorage on a firm, tenacious sandy beach. *Whangapi*, 20 miles S. of Wharo, extends 6 or 7 miles inland, gradually widening, from 200 yards at the entrance, till it expands into a beautiful bay, measuring 6 miles by 3. Hills rise abruptly to a great height on both sides of the entrance, and are covered with forests; but round the bay, between it and the hills, there is a space of fine flat land, from a quarter of a mile to 2 miles in breadth, which is clear of wood. *Hokianga*, a beautiful estuary, 80 miles S.E. of Cape Maria Van Dieman, in 35° 32′ S. lat., and 173° 27′ E. long. extending inland about 30 miles, is deeply indented by small bays and creeks, and receives the waters of twenty rivers and streams, most of them navigable for boats and small craft, and sufficient for floating the largest timber. There is good anchorage for ships of 500 tons on all sides of the channel up to the head of the bay. *Kaipara Harbour*, 60 miles S. of Hokianga, has an entrance 5 or 6 miles wide, but expands into a fine bay from 25 to 30 miles in length from north to south, and sheltered from every wind. Opposite to the entrance there is a sandbank in mid-channel; but on each side of it there is a channel with abundant water to carry in a vessel of any tonnage at any time of the tide, the smallest depth being 10 fathoms at low water. *Port Manukao* or *Manukou*, 30 miles S. of Kaipara, has an entrance about a mile wide, which afterwards expands to a width of 20 miles; it is separated from the Gulf of Shouraka by an isthmus of only three miles across. *Waikato Harbour*, 25 miles along shore, south-east of the entrance of Port Manukou, is formed by the navigable rivers Waikato and Awaroa; one of the affluents of the former, the Horoteu, is said to flow from a large inland lake called *Roturoa*. The approach to the estuary is rendered difficult and dangerous by a bar, and there is no safe harbour inside. *Waingaroa*, a bar harbour, 25 miles south of Waikato. *Aotea Harbour*, 10 miles south of Waingaroa, has a winding channel two or three miles long, which expands to a bay 10 miles wide. *Kawia Harbour*, 10 miles farther south, is a bar harbour, but has a good clear channel, three quarters of a mile at the entrance.

In the Southern Island:—*Blind* or *Tasman Bay*; a large triangular indentation, with *Massacre Bay* on its west side; *Admiralty Bay*; *Port Hardy*, in D'Urville's Island; *Port Gore*; the *Current Basin*, a strait connecting Blind Bay and Admiralty Bay; *Queen Charlotte's Sound*, which extends inland for 20 miles, with an entrance 26 miles wide, but soon narrowing to ten; *Cloudy Bay*; all on the north coast of the island, and on the south side of Cook's Strait. *Looker-on Bay*, *Pegasus Bay*, on the north

side of Banks's peninsula; *Akaroa*, a remarkably fine and safe harbour at the south-eastern extremity of Banks's peninsula; *Otago Bay*, to the north of Cape Saunders; all on the south-east coast. *Foveaux Strait* between Tavai-poenamoo and Stewart's Island; *Knowsley Bay* or *River* an estuary on the north side of the strait, which extends inwards for about 100 miles. And at the south-western extremity of the island, *Port Preservation*, *Port Chalky*, and *Ducky Bay*. The shores of Stewart's Island form a series of excellent bays and harbours, but they are encompassed by a great number of small islands and rocks. The island possesses, however, the very fine harbour of *Port Pegasus*, on its south-east coast, equal in every respect to that of Sydney, and superior to it in this respect, that it has three safe entrances.

CAPES.—*Cape Otou* or *North Cape*, 24° 25′ 30″ S. lat., where New Zealand terminates in barren precipitous sandhills, called the *Reinga* or *Flight*; and where the foaming Pacific unceasingly dashes against the towering black rocks which skirt the shore. Westward from North Cape, and separated from it by a deep sandy bay which affords no anchorage, is *Cape Reinga* or *Maria Van Diemen*, so named by Tasman in honour of the daughter of the Governor of the Dutch East Indies. About six miles off the Cape N.N.E. is a dangerous ledge of rocks named the *Columbia Reef*, over which the westerly winds cause the surf to rise to a great height; but in fair weather they are unseen. *Knuckle Point*; *Point Surville*; *Point Pocock* and *Cape Brett*, both at the entrance of the Bay of Islands; *Cape Brown*, *Point Rodney*, *Aiguilles Point*, *Barrier Cape*, *Cape Colville*, *Point Charles*, *Cape Runaway*, *Cape Wareka-heka*, *Cape Wai-apou* or *East Cape*, immediately behind which rises a remarkable high land about 3000 feet above the level of the sea; *Cape Cable*; *Cape Table*; *Matamauri* or *Cape Kidnappers*; *Black Head* or *Cape Tupoko-poko*; *Cook's Turnagain*; *Castle Point*; *Point Tehouka-kore*; *Point Obtuse*; *Cape Palliser* or *Kawa-kawa*, a fine, high, bold point; all on the east coast of North Island; *Cape Toura-Kiva*; *Cape Poliwero*; both on the north side of the eastern part of Cook's Strait. *Reef Point*; *Woody Point*; *Albatross Point*; *Cape Egmont*; on the west side of North Island. *Cape Farewell*, *Point Lambert*; *Point Jackson*; *Cape Koamaroo*; and *Cape Campbell*; on the south side of Cook's Strait. Behind Cape Campbell rises Mount Tako, a lofty snow-capt peak, which is visible at a great distance, and serves as an excellent land-mark for making Cook's Strait on this side. *Cape Saunders*, on the south-east side of Tavai-Poenamoo; *Cascade's Point*; *Bald Head*; *Cape Foulwind*; and *Rocky Point*; all on the west coast of that island; *South Cape*, the most southern point of Stewart's Island.

ISLANDS and PENINSULAS.—*Manawa-tawa* or the three kings, 35 miles N.W. of Cape Reinga; *Didi-houa*; *Motourkawa* or *Caralle*; *Tawiti-rahi* or the *Poor Knights*; *Hen and Chickens* or *Morotiri*; *Taranga*; *Moko-hinu*; *Funal*; *Shoutourou*; *Otea*; *Aride*; all to the north of Shouraka Gulf. *Shouraka*, a large hilly peninsula, which forms the eastern side of that gulf. *Currier*; *Hausez*; *Court of Aldermen*; to the east of Shouraka. The *Mayor* or *Touhoua*; *High Island*; *Motiti*; *Plate Island*; *Moutohora*; *Pouhia-i-wakadi* or *White Island*, an insulated mountain, like Stromboli, which constantly emits smoke, and affords a beautiful spectacle by night, in the columns of fire which issue from the crater at its summit, in the Bay of Plenty. *Houama-kokeno*, to the south of East Cape. *Tera-kako Peninsula* forming the north-east side of Hawke's Bay. *Mana* or *Table Island*; *Entry Island*; *Gaimara Islands*; *D'Urville Island*; in Cook's Strait. *Banks's Peninsula*, projecting 42 miles from the east side of Tavai-Poenamoo, and connected with it by a low sandy isthmus, forms a high table-land which rises abruptly from the sea, white, and visible from a great distance. It has been taken possession of by a French colony. *Solander Islands*, at the western entrance; *Bench Island* and *Rouabouki*, at the eastern entrance of Foveaux Strait.

RIVERS and LAKES.—Of these nothing is known beyond what has been already mentioned in connection with the Bays.

CLIMATE.—The peculiar position of these islands, which lie north and south, gives a different degree of temperature to nearly every few miles of country; and, owing to the generally narrow width of the land, and to the almost uninterrupted chain of mountains which runs through their whole length, mists and exhalations, drawn from the surrounding ocean, overspread the country, imparting to it a constant humidity, which produces a luxuriant vegetation, and a constant supply of water to the numerous streams which flow through every valley. The climate of the Northern Island is uniform and genial. In winter the thermometer on the coast rarely falls below 45°; and, during the height of summer, seldom rises above 85°. At Queen Charlotte's Sound in the Southern Island, Captain Cook found the thermometer, in the middle of summer, not to rise higher than 66°; in June or midwinter, it never sunk below 48°. This agreeable temperature contributes much to the unusual vigour of the vegetation, which is chiefly composed of evergreens; and allows the agriculturist to raise annually as many crops of leguminous plants as he chooses. The rains throughout the year fall in moderate refreshing showers, particularly in Eaheinomawe; during winter, rainy weather predominates in Tavai-Poenamoo. Spring, summer, and autumn, are extremely pleasant; being attended with none of the overpowering heats and sudden changes of New South Wales. At these seasons the rains fall heavily, but seldom for more than two days together. In winter, the winds from the east or south-east are seldom unaccompanied by rain. Westerly winds are, however, the most prevalent. They commence in the forenoon, rising to a smart gale; but subside at sunset to a placid calm. The whole range of the west coast then becomes a lee shore, and on that account is little frequented by shipping, for the surf, dashing to a great height, renders approach to the harbours impossible; and equally prevents vessels from quitting them. The westerly gales are also frequently accompanied by heavy squalls, which render it almost impossible for a vessel near the land to preserve an offing. The sea rises in proportion to the wind; and yet these violent storms are accompanied by fair weather overhead. In Cook's Strait these heavy gales are of frequent occurrence, a circumstance which causes it to be avoided by ships. The neighbouring mountains of Kai-kohuda are overloaded with vapours; and not only

increase the furious force of the blasts, but alter their direction in such a manner that no two gusts follow from the same quarter; and the nearer the shore the more their effects are felt. The west and south-west winds blow almost without intermission from May till September. North winds are least frequent throughout the year; and seldom more than four violent gales are felt from that quarter during the season.

VEGETABLE PRODUCTIONS.—Among the most distinguishing characteristics of New Zealand are its splendid forests, in which trees of many varieties are often met with of amazing girth, and all flourishing with the most luxuriant vigour. Those of the pine tribe command the principal attention, from their towering height, without a branch protruding to destroy their symmetry. The Cauri or yellow pine, in particular, will challenge comparison with any trees of the pine family, in beauty or utility; and there are, besides, many other species. The palm tribes exist in great number and variety; supplejacks grow to a great length, and render the dense forests almost impassable; the heart of the delicious palms, called e'rito, is highly esteemed; the kourou is equally prized, and also the saccharine roots of the ti or cabbage tree. The fruits indigenous to the country are few, and of little value. The principal is the haraka-maori or native fruit, which grows in clusters, and is about the size and form of the Spanish olive; it is of a bright yellow colour when ripe. The tawara is a parasitical fruit which grows among the decaying branches of the rata and other trees; it has the form and whiteness of the head of a cauliflower, and is of a sweet yet acrid taste when perfectly ripe; but when unripe it is exceedingly bitter. The taro (arum esculentum) of several species, a very farinaceous legume, is planted in the islands, especially to the southward. There are likewise various other fruits; but the most valuable of these to the New Zealander, as an article of food, is the kumera or sweet potatoe, of which there are many varieties, and some of them very farinaceous. It is said by the natives to have been brought from Tou-wahai, or the distant regions, by their earliest ancestors; it is in consequence regarded with veneration, and has many superstitious legends attached to it. The European or American potatoe, first introduced by Cook, and many other European esculent roots, are now cultivated with success. The turnip is found in a wild state over the whole country, as also wild radishes, garlic, celery, cress, &c. Pumpkins are much cultivated, and grow to a large size. The vegetable marrow plant and calabashes are of great use for containing liquids; and gourds of every kind are now found in all the plantations. Indian corn grows to a large size; and wheat yields at the rate of 40 bushels an acre. Grapes are largely cultivated to the northward of the river Thames; strawberries and raspberries overrun the soil wherever they are planted; olives, pomegranates, figs, quinces, nectarines, peaches, apples, pears, and cape gooseberries, thrive in abundance. The sugar-cane flourishes in Hokianga, and several tropical exotics at the Horeké settlement. Flowering shrubs which require the shelter of the greenhouse in England are not affected by exposure to the open air throughout all the seasons of New Zealand.

Of the rohi or fern upwards of sixty distinct varieties have been noticed by botanists. It is found growing to the height of twelve feet; and plains and sloping grounds are often rendered impassable by its entangling fibres. But it never grows on bad land, and the quality of the soil is generally indicated by the size and strength of the fern which covers it, inferior land producing only a stunted and puny vegetation. When sown with English grasses the fern-land produces excellent pasture, and clover in particular grows luxuriantly. There are many shrubs with myrtle leaves; the tea plant, kaikatoa, covers the plains, not excepting the jutting headlands which are exposed to the fury of every gale. The ground in the vicinity of the roots of trees, which extend to a great distance in the forests, is carpeted with mosses and lichens of beautiful varieties, which flower twice a-year. Funguses of great size and hardness cover the decayed trees which block up the forest paths; while the bark of the live trees is covered with liands, flowering convolvuluses, lichens, mosses, and ivies. There are many species of laurel; of which we may mention the philanthus or seaside laurel, and a species of the retiring mimosa, or sensitive plant, sheltered by the drooping branches of the dwarf palm. The erithmum or samphire abounds near the shores which are washed by the tides; and sea-weed in great variety, the most common of which is the fucus filum or threaded sea-weed, which strews the coast, and has its roots in the corals and rocks in deep water. Nightshade and various nettles grow extremely large; there are, besides, many species and varieties of minor vegetation, all of which have the same undying appearance in winter as the forests. But the most valuable native plant is the flax (phormium tenax) which flourishes in great abundance, and chiefly in the vicinity of swamps. Of this plant there is a consider-

able variety, principally caused by difference of soil and climate: some flax plants to the northward scarcely attaining the height of six feet, while others in the south reach sixteen. In appearance it resembles the common flax. Of the leaves of this plant the natives make all their valuable apparel, with their fishing lines and every kind of cordage; and by merely splitting them into strips and tying them together, they construct their fishing nets and seines, some of which are of enormous size. It appears to be the strongest of all vegetable fibres, and possesses this advantage over hemp and European flax that it is of a brilliant whiteness, which gives it a satiny appearance, so that it does not require to be bleached. It is also a handsome and vigorous plant.

ANIMALS.—There are no quadrupeds indigenous to the country. There is a species of dog, named pero, which according to tradition was introduced into the country in remote times by a number of divinities (probably the Spaniards) who landed on their shores; but it has dwindled away to the lowest grade of the canine family, owing to its bad treatment by the natives. The puorka or hog has also become naturalized, and now abounds in a wild as well as domestic state throughout the islands, where the loose mould of the valleys forms no obstacle to its snout in grubbing up the roots of the fern and the succulent thistle, on which it loves to feed. Cats and rats have also been recently introduced, and are valued by the natives as good food; the former are also prized for their skins, so that Europeans cannot get their cats kept for the thievish native gourmands. Sheep have been introduced, but seem not to be adapted to the country otherwise than as food. Cattle, horses, and asses have also been introduced, and thrive well. Birds are numerous, but are generally small. Among there are mocking-birds, parrots, parroquets, cuckoos, in great variety; and wood-pigeons, which abound in the woods, and are delicious food; besides many others, whose native names it would be useless to specify. European poultry have been introduced, as the turkey, duck, and goose, which, however, the natives seldom use as food, preferring to dispose of them at high prices to shipmasters. Tropical birds of the palmipede genus, and sea birds of many varieties likewise abound on the coasts.

There are no noxious reptiles; but there are a few harmless lizards, and the gigantic lizard or guana is found principally in the large Southern Island. There are no serpents or snakes of any kind; but leeches, toads, and frogs abound in the swamps. Fleas and the namu or sand-fly are mischievously troublesome; musquitoes abound in the numerous swamps; there are also butterflies of various kinds, but not remarkable for beauty, with locusts, grasshoppers, dragon-flies, black ants, beetles, scorpion-flies, flesh-flies, gad-flies, American moths, snails, grubs, earthworms, caterpillars, spiders, and also scorpions and centipedes, which, however, are of very small size, and quite harmless.

The coasts formerly abounded with seals of every variety, but they have been almost extirpated by Europeans. Black whales also frequent the coast in vast numbers in the winter season, or from May till September; and at a moderate distance from the land the sperm whale is occasionally found in large herds. There are also sharks, pilot fish, flying fish, and the hammer-headed shark, which appears in great shoals, and is preserved by the natives as winter food. Both the sea and the rivers abound with fish in great variety, and equal in taste and flavour to any in Europe. There is also abundance of lobsters, crawfish, oysters, prawns, shrimps, clams, poppies, mussels, limpets, and cockles. Some gigantic mussels grow to a foot in length, and are found in mud banks at low tide. There are also various zoophytes, madrepores, medusæ, which are found in large glutinous masses at the edge of the tide.

PEOPLE.—The New Zealanders form one of the finest branches of the Malay family, and embrace several varieties. Captain Crozet divides them into three classes: white or copper-coloured, brown, and black; but properly speaking, the colour varies only from the olive tinge of the southern Europeans to a brown black. The olive or copper-coloured race are a noble people, being often above six feet in stature, muscular, and active. The higher classes are amply chested, remarkably well formed, and of dignified appearance. Their countenances are often very pleasing; their hair is glossy, black, and curling; and their features approach the European standard. The lower classes, and particularly the natives adjoining the East Cape, are short in stature, with lank or frizzly hair, a brown complexion approaching to black, and a bad expression of countenance. The females of the latter class differ but little from the males in appearance, but the ladies of the upper class are quite different, and many of them would grace a page in "the Book of Beauty." The difference between the

distinct races which have inhabited the country is more remarkable in the women than in the men. Those of Malay origin are easily distinguished from the Papuas; but the flat nose, full lip, and projecting mouth of the latter are but rarely seen. In both races the female stature is less than the male. The features of the women are generally regular; the hair is often jet black, long, and profuse; and the teeth extremely white. The forms of the women are elegant and interesting; but marriage, and the servitude with which it is accompanied, cause early old age and decay.

The character of the New Zealanders exhibits, with great boldness of relief, many both of the virtues and the vices of the savage state. As individuals they are remarkable for a vigour of mind and a forethought, which distinguish them from all other savages who have made so little progress in the arts of civilized life; while their discernment in appreciating the advantages of civilization, is not greater than the energy and self-denial which they manifest in the pursuit of distant advantages. As a community, they are chiefly remarkable for the ferocity which they exhibit in the perpetual wars which ravage the country; for that contempt of human life which seems to be the natural result of a species of warfare that aims at the extermination or captivity of enemies; and for the practice of eating the flesh of the enemies they have slain, and even of their own slaves when pressed by hunger. The New Zealander's point of honour is revenge, and this he pursues in spite of danger and difficulty, encountering every fatigue, and submitting to every privation in pursuit of his object; and he would be disgraced among his tribe were he to allow the spirit of his friend or relation to remain unappeased by the blood of his enemy. With this is united a nice feeling of honour on other points that concern his dignity, which leads him immediately to perceive and resent any slight or insult offered to his person. But he is not more distinguished for ferocity and cruelty to enemies, than for a strength of attachment to his tribe and kindred, which dissolves the savage warrior in tears on the neck of his friend, whom he meets after a long separation; nor is he less susceptible of gratitude for kindness, than of resentment for injury.

The New Zealanders are ignorant of some of the commonest arts; their clothing is rude, and their agriculture imperfect; they have no knowledge of metals, or of writing; and yet they exhibit the keenest sense of the value of those acquirements which render Europeans so greatly their superiors. There is a natural politeness and dignity in their deportment, a love of poetry, music, and the fine arts, and a wit and eloquence that remind us of the Greeks of Homer. Their language is rich and sonorous, abounding in nice distinctions; it is radically the same with that of Tahiti and other Polynesian islands, and has been reduced to writing by the missionaries. They have abundance of poetry of a lyrical kind, and are passionately fond of music. They excel in carving, of which their war canoes are fine specimens; they display their talents also in astronomy, having given names to the stars, and divided them into constellations; and they spend great part of the summer nights in watching their motions; but they have connected with them some curious traditions, which they hold in superstitious veneration. They are quite free from idolatry, and have many just and admirable notions of God, whom they call Atua, and believe to be a spirit infinite and eternal, governing the world by his providence. They believe in a future state of existence. They believe also in an evil spirit or devil, whom they call Wiro, and to whom they attribute all the evils which befall them. They have also priests among them; but, as there are no idols to worship, these are rather teachers than priests; though they are employed to baptize and name the children.

The number of the population cannot be ascertained with any degree of accuracy; but it is loosely estimated to amount to 160,000, of whom at least 100,000 are in the Northern Island. They are divided into a great number of petty tribes; and no general dominion seems ever to have prevailed over any great portion of the country. But property in land, and the sovereign rights of their chiefs are well established institutions. They have no towns, and their villages are mere collections of huts; though some of them are strongly fortified with palisades.

DISCOVERY AND COLONIZATION. — New Zealand was first discovered by Tasman, the Dutch navigator, in December 1642; but he seems only to have touched at the northern point. It was not visited again till 1769, when Captain Surville touched at a bay on the north-east coast; and Captain Cook sailed round all the islands, and passed the strait which now bears his name.

In 1814, the northern part of the Northern Island began to be the resort of ships engaged in the whale fishery, and men occasionally deserted from their ships and took up their residence among the natives. About the same time, a few of the natives occasionally made their appearance at Port Jackson, and being seen and conversed

with by the Rev. Samuel Marsden, he conceived the idea of establishing a mission in the islands, which he accordingly visited for the purpose; and although not immediately successful, the ultimate establishment of a mission was the result. Since that period, the Wesleyan Methodists and the Catholics have established missions, all of which have of late years extended their influence, bringing the natives into familiar intercourse with the Europeans, and generally promoting their civilization, in spite of some questionable practices on the part of the church missionaries, which have brought them somewhat into disrepute. But the missionaries are not the only white men to whose influence the New Zealanders have been subjected; other settlers of a very different class, the very outcasts of a depraved population, have found their way to the country. Convicts who escaped from the penal settlements; runaway sailors from whaling ships; needy adventurers, whose improvident habits and evil courses had made them men of no country; with a small admixture of worthy and energetic men, such as will find their way into all eligible fields, but who formed too inconsiderable a minority to curb and neutralize the bad passions of the majority, formed the bulk of the European population in 1839. In 1836, an association was formed in London for the express purpose of colonizing these islands; but having failed in their object of engaging the Government and Parliament in their cause, the association became virtually dissolved; and instead of it a joint-stock company was formed for the purpose, which, early in 1839, became possessed, by purchase, of some extensive tracts in the Northern Island. More lately their agent in New Zealand acquired for the company the whole of the territory on both sides of Cook's Strait, including Port Nicholson, where they have since formed their principal settlement, and founded the town of Wellington. The attention and business of the company is "confined to the purchase of tracts of land, the promotion of emigration to these tracts directly from the United Kingdom, the laying out of settlements and towns in the most favourable situations, and the gradual re-sale of such lands according to the value bestowed upon them by emigration and settlement. It is also proposed, that to facilitate the transmission of capital between England and New Zealand, the company shall act as agents for that purpose only." The first colony consisted of 1125 persons, of a very select class, including several persons of birth, education, and refinement; but having been landed in the country without any provision being previously made for their reception, they have had to endure such hardships as have disgusted many of them, and occasioned grievous complaints.

Neither the New Zealand Association of 1837 nor the New Zealand Company of 1839 could gain the sympathy or even the countenance of the Government. By the energetic operations of the latter body, however, the Government were forced into action; and just as the first colony was ready to start, Captain Hobson of the navy was sent to New Zealand for the purpose of ultimately erecting it into a British colony. Unfortunately, New Zealand, or rather the northern portion of the Northern Island, had been treated in 1831 as a sovereign independent state, and Captain Hobson was instructed to begin by calling himself *consul*. He was then to obtain a cession of the sovereignty from the chiefs, and to declare so much of the country as should be ceded to him, and also such part thereof as should be in possession of British subjects, a dependency of New South Wales. Of this portion he was to cease to call himself *consul*, and was to become lieutenant-governor under the governor of New South Wales. In other words, New Zealand was treated as a foreign country, over which her Majesty could have no authority, until it should be obtained by formal cession, from the date of which sovereignty, with all its consequences, would commence. From this course of policy much difficulty has since arisen, and more will yet arise. It is a well-understood principle of international law, that discovery and occupation give to the discovering nation a right of sovereignty *as against all* civilized powers. The relations which the discovering country may establish with the native tribes does not in any way affect this right of sovereignty. The Americans, for instance, recognise a certain modified sovereignty as continuing in the Cherokees and other aboriginal tribes, but they nevertheless assert the sovereignty of the union as against all European nations. Of our original sovereignty over New Zealand no one ever doubted, until it was lately repudiated or renounced by the colonial department. Acts of sovereignty had frequently been exercised. Magistrates had been appointed; criminals had been arrested, sent to Sydney, tried, and punished many years ago; and yet it was determined that Captain Hobson should take a new lease of sovereignty, dating from a first cession or cessions from the natives. One of the consequences of this was, that New Zealand, which had all along been respected by foreign powers, was immediately thrown open to colonization by any European

power. France at once took the hint, and sent out the Comte de Paris transport with about sixty settlers, to found a French colony there. This expedition was only twenty days too late to take possession of the Southern Island in the name of France; Captain Hobson having at last, in May 1840, issued a proclamation, declaring the sovereignty of Britain over both islands, and thus anticipating the French.

The New Zealand Company have settled their first colony at Port Nicholson, which is described as one of the finest harbours in the world; and they expect that the town of *Wellington*, which they have founded there, will become the great commercial metropolis not merely of New Zealand, but of the whole of Australasia. The Bay of Islands is, however, the place which, above all others, appears to have been destined for the seat of a great commercial city. It combines every advantage which could be wished for supplying the wants of a large population, while it is at all times easily accessible for shipping. *Kororarika* is acknowledged to be the best harbour in the bay, and has the safest anchorage. The town already contains a fine church, and a great many houses, and is surrounded by an amphitheatre of gently swelling hills, from which flow several beautiful streams. There is to be a town named *Churchill*, at Hokianga; one named *Auckland*, at Waitemata harbour, on the Thames; and one named *Russell*, on the Bay of Islands. The New Zealand Company have also sent out a second colony, whose settlement is to be called *Nelson*.

In the great ocean to the south-east and south of New Zealand are several smaller islands. The *Chatham Islands*, 420 miles E.S.E. of Cape Palliser, were discovered in 1791 by Lieut. Broughton, the largest of which is about 36 miles in length, of a compact form, well wooded, and abounds in flax. The others are considerably smaller, and are named the *Two Sisters*, *Pyramid*, and *Cornwallis*. The group extends 120 miles from S. E. to N., between 43° 38′ and 44° 40′ S. lat., and 177° and 179° W. long. The inhabitants are a branch of the New Zealand family, and speak the same language. The *Bounty Isles* were discovered by Captain Bligh in 1788; they are thirteen in number, within a space of three miles and a half, in 47° 44′ S., and 176° 47° W. long. *Antipodes Island* was discovered in 1800 by Captain Pendleton of the sealing vessel Union, who gave it this name from its being the nearest land to the antipodes of London. It is situate in 49° 40′ S., 177° 20′ E. *Campbell's Island* was discovered in 1810, in 52° 43′ S. lat., 167° 2′ E. long. It is 30 miles in circumference, with a rocky coast, rising in the interior into peaks of considerable height. The *Auckland Islands* were discovered by Captain Bristow in 1807. They are situate in 50° 40′ S. lat. 164° E. long. The principal island is 20 miles by 8, with an elevated coast, and a lofty mountain, visible for 50 miles in clear weather. The smaller islands are named *Enderby*, *Disappointment*, and *Adam's Islands*. They are well covered with vegetation, and the forests contain trees of large size, and of a variety of species. The only quadrupeds are rats; but there are many beautiful birds, and the coasts abound with fish. The *Macquarrie Islands* were discovered in 1811, the principal of which is 19 miles long, by 6 broad, and contains two open anchorages. At a little distance north are two rocky islets, named the *Judge* and *Clerk*, and to the south, other two similar islands, named the *Bishop* and *Clerk*. The middle of the group is situate in 54° 39′ S., 156° 21′ E. long.

NEW GUINEA, &c.

NEW GUINEA is situate to the north of Australia, from which it is separated by Torres' Strait, between 0° and 10° S. lat. and 131° and 149° E. long.; being about 1100 miles in length, by 330 at its greatest breadth. It is of an irregular form, the western part being indented by deep bays, which almost cut it off from the more compact eastern portion. It is generally remarkable for its great elevation above the level of the sea; the northern coast in particular is high and mountainous. It is described, however, as being every where a rich and magnificent country, and probably contains the most precious vegetable productions of the Asiatic Islands. But no European colonists have hitherto settled on its shores; and no traveller has yet explored the interior. The only quadrupeds that are known to exist in the island are dogs, rats, and wild hogs; but the birds are of great beauty and variety. It is the original habitat of the beautiful birds of paradise. The people are of the Malaysian negro, or Puapuan race, and are invariably described by voyagers as hideously ugly, with large eyes, flat noses, thick lips, woolly hair, and a black shining skin. This natural ugliness they increase by passing bones or pieces of wood through the cartilage of the nose, and frizzing out their curly locks like a mop to an enormous size. They appear, however, to be somewhat farther removed from extreme barbarism than the Australians, for they have permanent houses, and both men and women wear wrappers round the waist. In the interior there are said to be some very miserable Haraforos, who live in trees, but cultivate the ground, and bring their produce down to the coast. The whole of New Guinea is indented with deep bays; and the coast is surrounded by multitudes of small islands, all peopled by Papuas, except those on the north-west, where Chinese and Malays have introduced themselves. The trade of the coasts is monopolized by the Ceramese, who have inspired the Papuas with an inveterate hatred of all other foreigners. The quantity of misoi or massoy-bark, nutmegs, trepang, tortoise-shell, pearls, edible birds'-nests, birds of paradise, and other articles of value, purchased by the Ceramese on the coast for an almost nominal price, and carried by them to Bali and Singapore, is incredible.

Off the south-west coast, at the distance of about 40 miles, and 100 miles N. E. of Timorlaut, are the *Arru Islands*, a group of some importance. They are small, rarely exceeding 6 or 7 miles in circumference, but so closely grouped that a number of them, when viewed from a distance, sometimes appear like a continuous land. According to Mr. Earle, they are hilly, but not mountainous, and the uplands are covered with trees; but, according to Captain Stanley, they are low and flat in appearance, and consist chiefly of a mangrove swamp, intersected by numerous chains, thickly wooded with fir trees. They are thickly inhabited by an industrious people, who seem to be a mixture between the brown and the black races of Malaysia. They are larger and more powerful than the Javanese and Malays; their hair is short and curled, but not woolly; their women are well treated; the majority are Pagans; but there are also many Christians and Mahometans. They are noted for their honesty, and are not easily offended. The islands are the entrepot for the productions of the neighbouring countries, and much commercial intercourse is maintained, chiefly with the Chinese, Bugis, and other native traders. Tortoise-shell, bees' wax, ambergris, massoy-bark, birds of paradise, trepang or sea-slug, and edible birds'-nests, are the principal exports. Fresh provisions and supplies for shipping may be procured in abundance. To the westward is another group, named the *Ki* or *Key* islands, the largest of which

is 45 miles in length, by 4 in breadth, mountainous and thickly covered with trees. Its highest point, near the centre, rises to the height of 3310 feet.

The remaining islands of Australasia, situate to the N. E. and S. E. of New Guinea, though some of them are of considerable size, are in other respects so unimportant, that it is sufficient merely to mention their names. They are mostly inhabited by varieties of the same negro races, except those to the S.E., where the negroes become mixed with the Polynesians. The principal of them are: the *Admiralty Islands*, *New Hanover*, *New Britain*, and *New Ireland*, to the north-east of New Guinea, from which they are separated by *Dampier's Strait*; *Louisiada*, a long chain of isles and reefs, extending to the eastward of the most easterly point of New Guinea; the SOLOMON ISLANDS, including *Bouka*, *Bougainville*, *Choiseul*, *Isabel*, *George*, *Guadalcanar*, *Gower*, *Arsacides*, *Buenavista*, *Rennel*, *San Christoval*, and many others; the NEW HEBRIDES, including *Tierra del Espiritu-Santo*, *Mallicollo*, *St. Bartholomew*, *Isle of Lepers*, *Santa Cruz*, *Duff Isles*, *Tabouai*, *Vanikoro*, where Perouse was wrecked in 1788, *Recherche*, *Mitre*, *Cherry*, *Tucopia*, *Bligh*, *Banks*, *Aurora*, *Pentecost*, *Apee*, *Sandwich*, *Frowango*, *Tanna*, *Hunter*, and *Walpole*; the LOYALTY ISLES; and NEW CALEDONIA. The last named island is 250 miles in length by 30 in breadth. It bears a great resemblance to New South Wales, consisting of barren rocky mountains, interspersed with fertile valleys; and many of the productions are similar. The people, however, are different, and are represented as strong, robust, active, and well made, courteous and friendly, and apparently a mixed race. Between New Caledonia and Australia is situate the *Coral Sea*, which is encumbered with shoals, reefs, and low islands.

III. POLYNESIA.

GENERAL DESCRIPTION.—This division of the world, as its name implies, consists of a great number of islands scattered over the Pacific Ocean, and extends from Asia, Malaysia, and Australasia on the west and south-west, to the wide open sea which washes the western shores of America. But, though innumerable, these islands, in respect of their general physical characteristics, may all be included under one general description. They are divisible into three classes; the mountainous, the hilly, and the low coralline. The islands of the mountainous class are, with few exceptions, truly splendid. The mountains rise gradually from their bases till their summits are lost amongst the clouds. Some of them are broken into a thousand fantastic shapes, and have their sides clothed with bright verdure of various shades. Beauty, grandeur, wildness, and sublimity are so fantastically blended and contrasted, as to excite the most varied and delightful feelings. The bases of the mountains are bordered by fertile and luxuriant valleys, adorned with stately bread-fruit trees, and many other tropical productions, some of which are of gigantic growth, and of the richest foliage, all equally beautiful, but each having its own peculiar hue, from the darkest shade of green to the lightest tint. The plumes of the cocoa-nut tree overtopping the whole, and waving majestically in the passing breeze, give an exquisite finish to the landscape. The mountains in the islands of this class have generally an elevation of from 2000 to 10,000 feet; in Hawaii alone they exceed 13,000. All of them exhibit evident traces of volcanic agency; in many the rocks are composed of a fine-grained black basalt; in others there are pumice and other stones of varied appearance, which have evidently undergone the action of fire; immense masses of conglomerated rubble are also met with. Whatever may have been their origin, it is evident that they must all have been under water; for on their loftiest summits, coral, shells, and other marine substances are found in great abundance. The islands of the second class are rather hilly than mountainous, being generally from 100 to 500 feet in height. They are in general equally beautiful in appearance, and equally luxuriant in their foliage with those of the first class; but are less sublime and romantic. The rocks consist of crystallized carbonate of lime, very much in appearance resembling the aragonite of the Giant's Causeway. The third class embraces the low coralline islands, most of which rise only a few feet above the surface of the sea. They are generally small; though Tongataboo is 100 miles in circumference. The soil upon them is in many places very thin, so that there is little vegetation besides the cocoa-nut trees, pandanus, some stunted hibiscus, with a few other trees of dwarfish growth, and a quantity of brushwood. Tongataboo, however, and all the Friendly Islands may be considered as exceptions; the soil there being much deeper, and every production of the islands of the first and second classes grows in them with luxuriant profusion. All the Society Islands, and also many others, are surrounded each with a belt of coral rock, from two or three to twenty yards in width, and situate at distances varying from a few yards to two miles from the shore. Against this barrier the long rolling waves of the Pacific are driven with terrific violence; and towering in one vast sheet to an amazing height, roll over their foaming tops with majestic grandeur. The waters of the lagoon, between the reef and the shore, are placid and transparent; the bottom and the sloping sides present a most enchanting picture; for coral of every varied shape and hue is seen intermingled in rich profusion, suggesting the idea of a submarine flower garden or shrubbery of exquisite beauty; while among the tortuous branches of the madrepore, and the wide-spreading leaves of other corals, the zebra fish and many others, of every colour and size, are seen gambolling in conscious security.—(*Williams' Missionary Enterprise.*)

The coral islands are classed as circular, flat, long-narrow, and those which encircle high land. The islands in the Dangerous Archipelago are all of the first class, and consist of strips or circular belts of coral from 400 or 500 yards to one mile across, and always inclosing a lagoon; they are seldom more than four or five feet above the water, and abrupt towards the ocean, which rapidly deepens on the outside to more than 120 fathoms. The islands themselves vary from 2 or 3 to 150 miles in circumference; the ring being often divided across by a fissure which permits ships to enter the lagoon. These are all the work of the coral insects, which are said to commence their labours at no greater depth than from 15 to 20 fathoms. The bottoms

of the lagoons are seen in calm weather at the depth of 100 feet or more, strewed over with shells and fragments of coral, rarely showing any living specimen below 16 or 17 fathoms, at which depth smaller reefs rise within the lagoon; and beyond it broken masses of rock may be seen without any living portion attached. Islands often occur of a flat or tabular form, generally oval or irregularly rounded; of which kind are most of the Friendly Islands. There are also many crescent-shaped reefs, having the convex side highest, which often show their position to the mariner only by the breaking of the waves over them, while the horns of the crescent gradually sink into the deep. In a few instances, however, as in Gambier's Island, they are high enough to be covered with vegetation and to be inhabited. Of those that form long narrow strips there is one called Tehuro near Tahiti; but the grandest example known is the *Great Barrier Reef*, which extends along the north-eastern coast of Australia, for more than a thousand miles, in the course of which space there is one continuous portion of more than 350 miles, with scarcely a break or passage through it. Of the last class of coral groups or reefs, those encircling high land, the Society Islands offer striking examples. These are mostly surrounded by reefs 400 or 500 yards from the shore, with a deep channel inside, containing numerous openings through which ships can enter, and afterwards anchor in perfect safety. These breaks are in most instances opposite the mouths of fresh-water rivulets. The islands of Raiatea and Otaha are enclosed in the same reef, the openings through which are in most cases marked by high and green points covered with cocoa-nut or other trees. Ships can enter at the windward side and get to sea again through the leeward channels, by passing through the strait which separates the islands. But of all these varieties of coral islands, the form must very materially depend on that of the base on which they happen to be reared; hence their circular, crescentine, oval, or irregular forms denote the shape and even the nature of the subjacent rocks. In most cases the bases of the small islands appear to be volcanic craters, either entire or broken; islands of volcanic rocks, as Tahiti, are surrounded by rings of coral; but the elevation of the coral islands seems to be owing not merely to the accumulation of matter produced by the rough action of the sea, but to a gradual rising of the low islands, and a violent subterranean movement of the high ones, like Tahiti, which bears on the top of one of its highest hills a distinct and regular bed of half fossil coral; and near it, but on a lower level, a volcanic crater with two lateral gorges.—(*Phillips's Geology*, p. 308–10.)

CLIMATE AND NATURAL PRODUCTIONS. — The greater part, and indeed almost the whole of these islands being within the tropics, the climate is necessarily warm, and little varied; the heat, however, is delightfully tempered by the presence of the vast body of water by which they are surrounded, and their climate and physical characteristics altogether may be said to justify the descriptive accuracy of the following lines:—

> "And, glittering in the sun's bright beams,
> Places there are where Ocean smiles,
> Meandering in a thousand streams,
> Among as many blooming isles:
> Seeming to the delighted eyes
> On earth a heavenly paradise."

But it is the smile of a giant who is not always *pacific;* for he sometimes rises in anger, and dashes with tremendous fury on the rocky barriers of the blooming islands, which are saved from destruction only by the labours of their tiny architects. The vegetable productions are, of course, all tropical; and the soil of the volcanic islands in particular is so fertile as to produce spontaneously in abundance, almost every thing necessary for the support or the enjoyment of man. The principal products are: the bread-fruit tree, of which there are many varieties, and the fruit of which affords a nutritive food, while the trunk supplies timber for buildings and canoes, a gum which serves for pitch, and a species of bark which is manufactured into a substantial cloth; the cocoa-nut tree, which supplies meat, drink, cloth, and oil; plantains and bananas of many sorts; yams and sweet potatoes; taro-root; sugar-cane, and various other edible roots and fruits. The only quadrupeds found on the islands when first visited by Europeans were hogs, dogs, and rats; but birds were numerous, consisting of poultry, pigeons, turtle-doves, parrots, tropical birds, &c. The shores abound with sea-fowl, and the sea teems with excellent fish, swimmers as well as crustacea, and mollusks, which the natives capture with great dexterity.

PEOPLE. — The Polynesians seem to belong to the Malay variety of mankind, and a general resemblance pervades them all; somewhat modified, of course, by the

circumstances of climate, occupation, and habits. Their persons are generally short, squat, and robust; their lower limbs large and heavy; their arms fleshy; their hands and feet small; their face somewhat of a lozenge shape, the forehead and chin being rather sharpened, but the cheekbones high and broad, with hollow cheeks. The eyes are black, small, narrow, and obliquely placed, like those of the Chinese; the nose broad, but not flat; the nostrils open and circular; the mouth rather wide; the hair lank, coarse, and black. Their complexions are of various hues of brown, generally olive or light copper, but making in some cases an approach to white or black. Every where they follow the same custom of marking their skins with indelible figures, often in elegant forms, but which have sometimes the effect of concealing their complexion, their faces in many cases being entirely covered with them. This process they call tattooing. They have been found to be all very nearly in the same state of civilization—the very children of nature; some of them indeed gentle in manners, but all addicted to serious vices; carrying on their petty wars with savage ferocity, and making lawful spoil of the persons and properties of every stranger who comes in their way, and can be mastered. As the climate of their islands renders little attention necessary in clothing or habitations, their arts with respect to these grand objects of more civilized communities were very simple; but in regard to instruments for procuring food and carrying on war, they display great ingenuity, though the want of metal has been a serious drawback. Their canoes they manage with great dexterity, and the ingenuity of their fishing tackle can only be exceeded by their skill in using it. Their hooks, however, are only made of pearl shells, bones, and hardwood.

LANGUAGE AND GOVERNMENT.—Dispersed as the Polynesians are, and rarely and purely accidental as any communication between distant islands must have been, it is nevertheless certain that the different dialects which they speak are all referable to the same common language, which seems still to form the original portion of the Malay; but their origin, with the time and manner of their migration and settlement in these innumerable islands, are problems which still remain to be solved. In manners, customs, institutions, superstitions, and religion, the general accordance of the Polynesians is as remarkable as in the case of their language. They have all the same form of government, the authority of which is generally divided among a number of hereditary chiefs, though there are also sometimes a sort of kings or superior chiefs to whom the others are subject, and to whom they pay great respect and even reverence. The people seem indeed in some of the islands, if not in all, to be divided into three classes or castes, the chiefs, the free proprietors, and the lower class, or serfs. In the whole of Polynesia the nobility are incredibly proud, and hold the people in a degree of humble subjection, of which it is difficult for people in Europe to form an idea. In Tahiti the distinction of caste was formerly carried to such an extent in the case of the royal family, all the members of which were regarded as sacred in the highest sense of the word, that whatever any of them happened to touch became sacred also; if the king entered a house the owner was forced to abandon it; and if he walked on a footpath it was death for a plebeian to walk on it afterwards. In the Friendly Islands the castes are still better defined; but the priestly caste ranks highest, the high-priest or Tooitonga taking precedence of the king himself. That singular institution indeed, or superstition, called *taboo*, by virtue of which the king, the nobles, and the priests contrived to appropriate any thing to themselves, was lately prevalent throughout the whole of Polynesia. By means of it the people were contented to be robbed of their property, and to suffer without murmuring any privations which might be imposed upon them. When their houses were tabooed, they dared not enter them; when their taro-roots, or their hogs were tabooed, they surrendered them without a struggle, when the morais or temples were tabooed, they dared not approach them. In short, whenever this mystical word was proclaimed, all action in reference to the matter or thing tabooed, became forbidden to the people.

RELIGION.—Their religion is polytheistic; every family has its guardian spirit, whose image they set up and worship; but they have also a god or gods of a superior order, whom they call Atooa or Eatooa, or some other form of the same word; but to these they address their prayers only in times of the greatest distress, or on some peculiar exigency; supposing them too exalted to be troubled with matters of less moment than the illness of a chief, storms, general devastations, or some other great calamity; and on these occasions they sometimes propitiate the deities with human sacrifices. Their priests are numerous, and have plenty of employment; they are required to be present and to officiate on all occasions of births or deaths, feasts or

sickness, and are the physicians as well as the clergy of the islands. They generally believe in a future state of existence; but not in a place of punishment; for they believe that all will enjoy degrees of eminence and felicity in proportion as they have been acceptable to the gods while on earth. They regard indeed the spirits of their ancestors as exalted into eatooas, and seek to secure their favour by offerings and prayers. Every sickness and untoward accident they consider as a judgment; and on all such occasions the priest is employed to pacify the offended deity. They believe also in dreams; but it were endless to repeat their superstitious notions, which in fact they only hold in common with savages in every part of the world; though unhappily some of their most cruel and most unnatural customs are connected with them.

DIVISIONS.—Some of the islands are collected into groups of various dimensions, while others are scattered solitarily, far in the ocean. The groups are exceedingly different in their number and extent, as well as in the nature of the islands that compose them; the following classification will be found to embrace them all:—1. *The Bonin* or *Arzobispo Islands*; 2. *The Ladrone* or *Marian Islands*; 3. *The Carolina Islands*, including the *Palaos* or *Pelew Islands* at the one extremity, and the *Ralick*, *Radick*, *Marshall's*, and *Gilbert's Islands* at the other; 4. *The Feejee* or *Fiji Islands*; 5. *The Tonga* or *Friendly Islands*; 6. *Navigator's* or *Samoa Islands*; 7. *Cook's* or the *Hervey Islands*; 8. *The Society*, *Georgian*, and *Low Islands*; 9. *The Austral Isles*; 10. *The Marquesas* and *Washington Islands*; 11. *The Hawaiian* or *Sandwich Islands*; 12. *The Kermadec Isles*; and 13. *The Scattered Islands* unconnected with these groups.

§ 1. *The Bonin Islands* or *Islas del Arzobispo.*

These are a group of small islands situate to the south-east of Japan, between 24° and 30° N. lat. and 140° and 150° E. long. They are 89 in number; but 19 of these are only reefs or shoals. The northern islands are inhabited by a Japanese colony. One of the largest, named by Captain Beechy *Peel Island*, contains a harbour called Port Lloyd, which is situate in 27° 5′ N. lat., and 142° 11′ E. long. Water, wood, turtle, fish, and the cabbage-tree, are abundant. A number of British subjects have recently settled on the Bonin Islands, from which they carry on a contraband trade with Japan, or engage in the whale fishery. To the south of the Bonin Islands, properly so called, is a volcanic group, where there are still active volcanoes in *Sulphur*, *St. Alexander's*, and *St. Augustine's* islands. To the south-east are the scattered islands of *Guadalupa*, *Malagrida*, *Grampus*, *Volcano*, and *Meares*; to the west, *Kendrick*, *Dolores*, and *Borodino*.

§ 2. *Ladrone* or *Marian Islands.*

This group extends from south to north between 12° and 21° N. lat. and 144° and 146° E. long. They all belong to the Spanish Government of the Philippines; but only the five southmost are inhabited; all the others being entirely uninhabited, and overrun with wild cattle, hogs, and goats. Their geological formation is almost entirely volcanic, and they seem to be merely so many fragments of land of a very barren and unpromising aspect. The coasts consist chiefly of black and brown rocks, while the interior rises into hills and even mountains; but they also contain fertile valleys, and abound with every thing necessary to human subsistence. *Guam*, *Guajam*, *Guahan* or *San Juan*, the largest of these, contains the capital and seat of Government, named *Agana*, which has a population of 500. The others are: *Saypan* or *St. Joseph*; *Rotta*, the most populous after Guam; *Aguigan*, and *Tinian*. The last two are remarkable for the monumental remains of the ancient inhabitants. In the Island of *Arigan* a small Anglo-American colony has been planted with the permission and under the domination of the Spaniards. *Assomption* and *Pagan* are noted for their volcanoes; but Captain Beechy found the latter not only quiescent and free from smoke, but covered to the summit with vegetation, and rising to an elevation of 2026 feet.

§ 3. *The Carolinas* or *Caroline Islands.*

These, including the Pelew, Ralick, Radick, and Marshall's Islands, extend through forty degrees of longitude, between 133° and 173° E. and between 3° and 16° N. lat. The Carolinas Proper are classed by Captain Lutke into forty-six groups, containing several hundreds of isles and islets. The largest of them seems to be *Ualan*, which is 24 miles in circumference, divided by a valley into two mountain masses, the summits of which rise respectively to 1854 and 1867 feet above the level of the sea. In productions they resemble the rest of Polynesia, except that the bread-fruit abounds only in the eastern islands, and the hog only in the Palaos. They are situate in a very tempestuous part of the ocean, and are exposed to violent hurricanes; yet their inhabitants are more addicted to the seafaring life than most others of the Polynesians. They even equip large sailing barks, in which they maintain a commercial intercourse with the Ladrones. The *Palaos* or *Pelew* Islands form a western appendage to the Carolinas, from which they do not differ materially in character. They are of moderate elevation, rise into beautiful hills, and are well wooded; but they are bordered by dangerous coral reefs. They became an object of interest in Britain towards the end of last century, in consequence of the shipwreck, on one of them, of the Antelope, Captain Wilson, whose crew was most hospitably received by the natives. The principal island is *Babelthouap*. *Ralick*, *Radick*, *Marshall*, and *Gilbert* islands, to the east and south-east of the Carolinas, consist of a crowd of low coral islets, affording but a scanty supply of food, and entirely destitute of any land animals except rats. The inhabitants are described more favourably than almost any other in the South Seas, as friendly, courteous, and amiable; free from the thievish propensities and dissolute conduct that are so general. To the southward of the last named groups are the small islands of *Grand Coral*, *St. Augustine*, *Nederlandish*, *Pegster*, *Enderbury*, *Independence*, *Jesus*, &c.

§ 4. *The Feejee*, *Fidji*, or *Viti Islands*

Are situate to the south of the preceding groups, and to the eastward of the New Hebrides. The largest and most important is named *Viti-Levou*; the next, *Vanoua-Lebau* or *Pau* or *Paou* or *Savage*

wood *Island*, for the supply of which article it has been much resorted to by the Anglo-Americans. *Mywolla* or *Nawihi Lewcos*, *Amboa* or *Bao*, is remarkable for its extent and its peak, which has an elevation of 3600 feet. The islands are well peopled by a race, who, if not altogether negroes, have at least several negro features; and are probably of the same lineage as the Haraforos of Malaysia. Though somewhat advanced in civilization, they are, nevertheless, fond of war, perfidious, ferocious, and incontestibly habitual cannibals. To gratify this horrid propensity they make war, murder, kidnap, and absolutely rob the grave of its prey; and it is said, on credible authority, that 200 human bodies have been known to be devoured at one great feast.—(*As. Journal, Oct.* 1838, p. 103.) The whole group, and even individual islands, are divided into petty independent states, which are often at war with each other. The total number of islands is reckoned to be two large, two small, and fifteen smaller, besides innumerable islets, shoals, and reefs.

§ 5. *The Tonga* or *Friendly Islands.*

This group consists of four principal islands named *Tonga* (*Tongataboo* of Cook), *Anamouka*, *Vavao*, and *Eoua*, besides a great number of islets and rocks. They formed lately one state under King Finow I., but are now divided among a number of independent chiefs. Tonga is the largest and most populous; it is about 100 miles in circumference, but perfectly flat, and rises only a few feet above the level of the sea. The soil, however, is very rich, and carefully cultivated, so that it supports a numerous population. Anamouka is said by early voyagers to have had two active volcanoes; and there is still one which is very active, in *Tafoua*, a little to the north. *Vavao* and the islands which surround it consist of masses of barren rocks, of compact crystalline limestone, from 30 to more than 100 feet high, and many of them inaccessible. Vavao itself, however, is covered with timber, and contains the best harbour in the group; excellent, perfectly landlocked, of great extent, and with numerous entrances, all to the west. To the westward is the Island of *Latte*, which contains a lofty peak. The *Hapai Islands* lie midway between Tonga and Vavao; and form a cluster of 30 or 40 small coralline islands, of which about the half are inhabited. The principal island is *Lefuga*. The inhabitants of all these islands are of a dark brown complexion, and many of both sexes present almost perfect models of the human figure. Their behaviour to Captain Cook was so friendly, that from that circumstance he gave their islands the name which they now bear. They have exhibited, nevertheless, in more recent times some of the worst features of the savage character; their wars are carried on with reckless ferocity, and they make no scruple to murder the crews of such vessels as fall into their hands. They are equally perfidious and cruel to strangers; and yet among themselves they are said to be well-behaved, and even ardent in their attachments.

§ 6. *The Navigator's* or *Samoa* or *Hamoa Islands.*

These islands are situate to the north-east of the Fidji and Friendly Islands; they are eight in number, named *Maûna*, *Orosenga*, *Ofu*, *Tutuila*, *Upolu*, *Manone*, *Aborima*, and *Savaii*. The parallel of 14° S. and the meridian 170° W. pass through the centre of the group. Manûa is circular, and so high as to be visible at sea for 40 or 50 miles, with a bold and lofty shore. Tutuila is a fine romantic island, 80 or 100 miles in circumference. Upolu is from 150 to 200 miles in circumference, and so lofty as to be visible for 50 or 60 miles, richly verdant to the top, and possessing several fine harbours. Savaii, the largest of the group, is 350 miles in circumference, with mountains visible for 60 or 70 miles, all clothed with noble forests, and presenting a scene of beauty, which in extent and importance yields to that of few islands. Aborima is only two miles in circumference, and 200 or 300 feet high; it is the crater of a volcano, precipitous and inaccessible outside, but forming a fine amphitheatre within. The islands produce abundance of the usual vegetable food of Polynesia, and abound with dogs, poultry, and hogs. The men are of colossal stature, and finely formed; their complexion is very light. In talent and character they much resemble their neighbours.

§ 7. *Cook's* or *the Hervey Islands.*

These are seven in number, between 18° and 23° S. lat., and 157° and 160° W. long., and are named *Mauke*, *Mitiaro*, *Atiu*, *Rarotonga*, *Hervey's Island*, *Aitutaki*, and *Mangaia*. They are, however, small and unimportant. Rarotonga, the largest, is about 30 miles in circumference, surrounded by a reef, and rises into a mass of mountains of romantic appearance. It has several good boat harbours. The others are of much the same character, only moderately hilly, but verdant and beautiful. The state of society is similar to that of Tahiti, and the missionaries have succeeded in converting a considerable number of people.

§ 8. *The Society, Georgian,* and *Low Islands,* with *the Dangerous Archipelago.*

These together form a widely extended group, situate between 134° and 157° W. long., and 14° and 25° S. lat. The western portion is generally named the Society Islands; and the central, including Tahiti, the Georgian; while the Low Archipelago consists of a very numerous group to the east and north-east of the two former. *Tahiti* or *Otaheite*, is the largest of them all. It consists of two peninsular mountain masses, connected by a low isthmus; the larger of which is almost round, with a circumference of nearly 90 miles; and the smaller, oval, with a circumference of 50; both are surrounded by a coral reef. Each of the peninsulas is bordered by a belt of low land, from a furlong to a mile in width, from which the central mountains rise by a slow and gradual slope. The summit of the large peninsula is between 6000 and 7000 feet above the level of the sea, and is said to contain a lake of yellow water, probably the crater of an extinct volcano. There is another curious lake about 1500 feet above the level of the sea, and about a mile in circumference, in the bottom of a deep circular valley, surrounded by precipitous mountains. The lowland and the valleys, with their intervening ridges, are beautiful, being clothed with a great variety of trees and abounding with every vegetable production suited to the soil and climate. Since the beginning of the present century, the guava shrub was introduced from Norfolk Island, and in spite of every effort to check its progress, now encroaches on all the moist and fertile land, so that all the woodlands and bush, for miles in extent, are composed of this shrub, which bears a profusion of large and delicious fruit. The indigenous animals are hogs, dogs, and rats; but saddle horses, imported from South America, are now in general use; cattle are also numerous, and ships may be supplied with beef of good quality at 2d. a-pound. Cats have also been naturalized, and are found to be extremely useful. Common poultry are abundant; and the woods are filled by vast numbers of parrots and pigeons. The shores abound with sea fowl, and the sea with excellent fish. The inhabitants are of an olive colour or light copper. The men are generally above the middle size; the chiefs are almost uniformly tall, muscular, and well limbed; the women of the upper ranks are also tall, with limbs finely turned, and soft and delicate skins; black, sparkling, and expressive eyes; beautifully white and regular teeth; jet black hair, generally ornamented with flowers, and a firm, easy, and graceful gait. They have advanced but little in civilized habits, since the days of Wallis and Cook; their dwellings are still much the same as described by their earliest visitors; and Euro-

pean clothing is adopted, but to a very small extent. They have been nearly all converted to Christianity; but their principal improvement consists in religious observances, and in the acquisition to a great degree of the elements of literary education. They amount to about 15,000 or 20,000, under the pastoral care of eight missionaries. At Tahiti and all the Society Islands, elephantiasis prevails to a great extent, not only among the natives, but also among the Europeans. The commerce of the island is confined to the exportation of pearl shells and pearls, sugar, cocoa-nut oil, and arrow root; and it is conducted entirely by foreigners, the natives not possessing any vessel larger than a double canoe. The island, however, is much frequented by British and American shipping, and consuls from both nations have been appointed to reside at Tahiti. The government is administered by a king or queen, and in the districts by chiefs, who form a sort of feudal aristocracy. But the power of the monarch is absolute, and he is sole proprietor of the lands of the island. The revenue consists of taxes on cloth, oil, pigs, and arrow root. The other principal islands of the Georgian and Society group are: *Eimeo*; *Teturoa*; *Tapamanoa* or *Saunder's Isle*; *Huaheine*; *Raiatea* (*Ulitea* of Cook); *Otaha*, *Bolabola* or *Borabora*; and *Maurua*. They are all, like Tahiti, lofty, volcanic, and fertile; and their inhabitants are generally better Christians than the Tahitians. The *Low Islands* and *Dangerous Archipelago* consist of a few high or hilly islands, and 70 or 80 groups of islets surrounding lagoons, like the attollons of the Maldives, besides many mere reefs. The Dangerous Archipelago is deserving of the name; for numerous coral reefs only a few feet above water obstruct navigation, while currents and strong squalls add to the risk. Most of the lagoons have harbours accessible to shipping.

§ 9. *The Austral Isles*

Form a long chain to the southward of the Society and Low Islands, and might indeed be considered as a part of the same group. The principal are *Rimatara*, *Oheteroa* or *Rurutu*, *Toobouai*, *Raivaroi*, *Osborne*, *Oparo*, *Pass*, and *Rapa*. They are high, fertile, and beautiful. To the south-south-west of Rapa, at the distance of about 640 miles, is a solitary reef named *Lancaster*.

§ 10. *The Marquesas* and *Washington Islands.*

These are properly one group; the former name was bestowed upon them by Mendana their first Spanish visitant in 1595, in honour of the Marquis of Mendoça, the viceroy of Peru; the latter name has been applied by Anglo-American voyagers to one portion of the group, in honour of their great president, as having been first explored by them. The centre of the group may be reckoned about 9° 30′ S. lat., and 139° 30′ W. long. They belong to the class of high islands; their mountains, some of which rise to the height of 5000 or 6000 feet, are extremely broken and craggy, with a sandy belt of land between them and the sea; but the intervening valleys are singularly fertile and picturesque, being copiously watered by streams, which form numerous cascades, one of which, in Noukahiva, is said to have a fall of 2000 feet. The men are described as tall, robust, and among the most finely formed of the human race; their complexion even is said by some voyagers to be little darker than that of Europeans; but is completely hid in the elder people by tattooing. Captain Waldegrave, however in 1833, says that their complexion is a dark copper. The women have handsome features, but a slouckling gait and ill formed limbs; and are not remarkable for modesty or propriety of conduct. The character of the people is that which generally belongs to savages. In their ordinary intercourse they are friendly, open, and engaging; but they carry on war with the most deadly ferocity, piercing the brain of the vanquished enemy, and eagerly drinking his blood. The Islands are divided among a number of independent chiefs and tribes. The principal islands are *Noukahiva*, *Oouhouga*, *Federation* (*Hood Island* of Cook), *Ohitwee* or *Dominica*, *Mohaee* or *Sir Pedro*, *Fatouiva* or *Madalena*, *Tuoutta* or *Santa Christina*, *Lincoln*, *Onayeo* or *Trevennen*, *Halioi*, &c.

§ 11. *The Hawaiian* or *Sandwich Islands.*

These form a solitary group far to the north of those we have been describing. They are thirteen in number, eight of which are of moderate size, while the other five are mere islets. They are situate between 19° 30′ and 22° N. lat., and 155° and 160° W. long. The names of the eight larger islands are: *Hawaii* or *Owhyhee*; *Maui* or *Mowee*; *Kahoolawe* or *Tahoorowee*; *Morokai*, *Morokeo* or *Mowee*; *Ranai* or *Lanai*; *Oahu* or *Woahoo*; *Kauai*, *Tauai* or *Atooi*; *Nihau* or *Oneheow*. They all are hilly and mountainous, exhibiting in strong contrast luxuriant verdure and volcanic sterility, and some of them present a very forbidding aspect. The soil is chiefly composed of decayed vegetable and volcanic matter, and is capable of producing any thing; indeed, its fault is that of being too rich. The native vegetable productions are yams, taro, sweet potatoes, plantains in great variety, bread-fruit, sugar-cane, nono, ohaa, turmeric, ginger, cotton, and sandalwood. European and West India fruits flourish, and require little attention. Taro forms the principal food of the natives; but many European vegetables are now produced, and sold in the markets; particularly tobacco, melons, water melons, rice, grapes, cucumbers, cabbages, beans, oranges, pine-apples, and the cloth plant. The indigenous quadrupeds found by Captain Cook were hogs, dogs, and rats; but there are now horses, asses, bullocks and goats; fowls, ducks, and geese are abundant. The people call themselves Hawaiians, after the principal island. The common people are of moderate stature; but the chiefs, both male and female, are remarkable for their great size and flabby obesity. Their complexion is olive. They are now a mild race, tolerably docile and capable of improvement; they are expert at athletic exercises, and as swimmers, are unrivalled. In 1836 the population of the inhabited islands was as follows:

Hawaii,	39,193	Kahoolawe,	85
Oahu,	27,798		
Maui,	24,155	Total,	108,304
Tauai or Atooi,	9,927	Total in 1832,	129,814
Molokai,	6,000		
Lainai,	1,290	Decrease in four years,	21,423

The Hawaiians have been Christianized by American Calvinistic missionaries, who are supported by a society in the United States; but their system of instruction is so entirely religious, and so exclusively directed to the observance of the Calvinistic forms of worship, and the inculcation of Calvinistic doctrines, that it has proved of less social advantage to the people than might have been expected. The labours of the missionaries consist exclusively in preaching, and in teaching schools. They have undoubtedly exercised a very beneficial influence on the people, who may now be called a Christian nation; but they have Christianized without civilizing them. They have overlooked the fact that the Bible teaches neither political economy nor agriculture. The government, in consequence, remains in all respects the same as it was before the missionaries landed. It exhibits a decidedly monarchical character; there being one sovereign chief or king, under whom subordinate chiefs keep the people in the most abject dependence. To the missionaries, however, is due the credit of having reduced the language to writing; they have also translated the Bible into the native tongue; and from the mission press there is now issued a journal called the Hawaiian Monitor, filled with extracts from the Bible, scraps of natural history, and other subjects calculated to interest the people.

When first discovered by Cook, the inhabitants were in the same state of civilization as the other Polynesians; but the islands being most conveniently situate as a station for vessels sailing between China and the north-west coast of America, they were in consequence frequently visited both by Europeans and Americans, who introduced some of the arts, and not a few of the vices of Europe. The islands formed likewise so many independent states; but towards the end of last century and the beginning of the present, they were all subjected to one monarchy by King Tamehameha I., who seems to have fully appreciated the advantages of European improvements. He was a great reformer as well as a conqueror, but adhered tenaciously to the faith and customs of his forefathers; and it was only his son and successor Riho-Riho, or Tamehameha II. who abolished idolatry, so far as connected with the government, and laid the foundation of social improvement among his subjects. This happened in 1819: in the following year missionaries were first allowed to settle in the islands; and though the novelty of the new religion has now lost its effect, and the people have relapsed, in a great measure, into their former habits, yet the seeds of civilization have been sown among them, and may at some future time produce good fruits.

Honororu or *Honolulu*, in the island of Oahu, is the seat of government and trade. It is a considerable town, containing 6000 or 7000 inhabitants, and several comfortable houses; and is protected by a small fort. As a port it possesses many advantages, and supplies for shipping are abundant, and reasonable in price. The commerce, which is chiefly carried on by Anglo-Americans, consists in the importation of cattle from California and Mexico, for which either Chinese or American produce is returned; or of sandalwood, and furs from the north-west coast of America, for the Chinese market.

Hawaii or *Owhyhee*, the largest island in the group, and indeed in Polynesia, is above 100 miles in length from north to south, and about 70 or 80 in breadth, forming a sort of triangle with irregular sides. It contains three lofty volcanic mountains, and, besides these, contains also the largest active volcano at present known. *Mouna-kea* or *Mouna-kaah* (White Mountain) rises to the elevation of 13,764 feet above the level of the sea; *Mouna-roa* or *Mouna-Loa*, to 13,430; and *Huararai* or *Whararai*, to 8457. The ascent of Mouna-kea is comparatively easy. Up to 8700 feet it is covered with luxuriant vegetation; from that point to 12,000 feet, the flanks of the mountain are broken into deep chasms and ravines, interspersed with numerous small extinct craters; at 12,700 feet, a vast table-land or plain is spread out, covered with sand, gravel, stones, and scoriæ, above which rise eleven peaks or humps, forming the summits of the mountain, which, however, do not reach the line of perpetual snow. The ascent of Mouna-roa is more difficult; the limit of vegetation rises to 10,724 feet; but all above that is an immense dome of lava, entirely destitute of verdure; and on the very summit is an enormous crater, 6¼ miles in circumference, enclosed in a larger one, which is 24 miles round. Both of these mountains were ascended, and their elevations barometrically ascertained, by Mr. David Douglas, the botanist, in January 1834.—(*Journal R. Geog. Soc. Lond.* IV. 333.) They are both situate considerably inland, and form together the nucleus of the island. Huararai is situate on the west coast, but has not been in activity since 1800. There are many other dormant or extinct craters; but *Kirauea* or *Kirura* excels all the others in extent and terrific grandeur. It is situate at the eastern base of Mouna-roa, about 3873 feet above the level of the sea, according to Mr. Douglas, or, according to others, 4104. It differs from all other volcanoes in not forming a cone-shaped mountain; it is, on the contrary, a vast sunken pit, of an oval but somewhat irregular shape, about 1000 feet deep, with very steep and almost perpendicular sides. The bottom consists of half-cooled scoriæ, intermixed with torrents of earth in igneous fusion, and gases, constantly effervescing, boiling, spouting, and rolling in all directions, like the waves of the sea in a storm, and dashing like an infuriated surf on the edges of its cauldrons. At the south-south-west point is the haule-mau-mau or great abyss, to which the Hawaiians used to consign the bones of their chiefs, and where they made their offerings to the goddess Pele, who presided over the scene. This exhibits a most frightful area of bubbling red hot lava, incessantly changing its level, sometimes rolling long curling waves, with broken masses of cooled crust, to a side, and again furiously turning them back with a terrific noise. Around are blocks of lava, scoriæ, and slags, in every variety of form and combination; here forming deep and rugged precipices of numerous layers, there all dispersed, cracked, and broken. In extent, grandeur, and intensity of action, Kirauea is unrivalled among volcanoes: but, though from time immemorial it has been prodigiously active, it has never been known to overflow, except in the year 1787, when a dreadful eruption took place, which lasted seven days and nights. The accounts given by those who have visited the place are extremely various; which may be accounted for by the circumstance of the interior of the pit undergoing continual changes. Dr. Goodrich Gardner, as he states in a notice read to the Royal Geographical Society, has conversed with natives not more than thirty or forty years of age, who have seen salt water at the bottom of the crater. There were then four ledges of rock between the upper margin and the bottom; it has since filled up so far as to leave only one; and as the others are said to have been of almost equal depth (800 feet) the bottom must have been then nearly at the level of the sea. At the time, there was a saltwater lake at the bottom of the one end of the crater, while lava was boiling up at a little higher level at the other. A new volcano broke out in 1832, on the north-eastern declivity of Mouna-roa, about 20 miles from Kirauea, but has not been active since. Dr. Gardner saw no traces of stratified rocks in the lower regions of Hawaii, near the sea shore; and he states it as a curious fact, showing the influence of moisture on vegetation, that on Mouna-roa the forests are limited to the sides extending from north to south-east, there being hardly any wood on the sides extending from north-west to south-west, which renders the ascent on that side the most easy. A line of craters stretches almost across the island, in a direction east and west to Mouna-roa.

§ 12. *Kermadec Islands.*

These are a small group, consisting of three small inhabited islands, with some desert islets and reefs, situate about midway between the Friendly Islands and New Zealand, in lat. 30° S. The names of the three inhabited islands are *Raoul* or *Sunday*; *Recherche* or *Macaulay*; and *Curtis*. To the south of them are *L'Esperance Rocks.*

§ 13. *Scattered Islands.*

To the westward of the Sandwich Islands extends a long chain of scattered islets and rocks, in the following order: *Bird's Isle*; *Necker*; *Basse Française*; *Gardner*; *Two Brothers Rock*; *Maro Reef*; *Laysan*; *Lisianski*; *Philadelphia*; *Pearl and Hermes Bank*; *Cure*; *Byers*; *Patrocinio*; *Morell*; *Roco de Plata Crespo*; *Rica de Oro* of the Spaniards; *Rico de Oro* or *Lot's Wife*; *Columas*; *Ganges*; *Week's Reef*; *Krusenstern Rock*, to the south-west of Laysan; and *Mellish Bank*, north of Byers.

Between Gilbert's Islands and the New Hebrides on the west; the Fidji, Friendly, and Navigator's Islands, on the south; the Society, Low Islands, and Marquesas, on the south-east; and the Sandwich Islands on the north, the following may be mentioned: *Howland*, *Arthur*, *Kemin's*, *Jervis Birney*, *Phœnix*, *Sydney*, *Duke of York's*, *Duke of Clarence's*, *Solitaria*, *Danger* or *St. Bernardo*, *Duke Alexander I.*, *Humphrey*, *Suvarof*, *Peregrino*, *Penrhyn*, *Woodstock*, *Caroline*, *New York*, *Starbuck*, *Volunteer*, *Maldon*, *Brook*, *Bunker*, *Christmas*, *Palmyra*, *Washington*, *Fanning*, *Walker's*, *Smith's.*

To the eastward of the Low Islands:—*Oeno, Gambier, Pitcairn, Elizabeth, Ducie's, Easter, Sala-y-Gomez, Waihou. Gambier Islands*, consist of five large, and several smaller islands, all within one reef, through which there is a navigable ship channel to the lagoon. The largest rises 1428 feet above the level of the sea. *Pitcairn Island* is only three miles in length by one in breadth, but has acquired some notoriety as being the place where several of the mutineers of the Bounty, in 1789, established themselves, and planted a small colony. It is volcanic, of a fertile soil, and its peaks rise about 1000 feet above the level of the sea. Its village, named Adamstown, is situate on the north side, in 25° 4′ S. lat., and 130° 16′ W. long. *Easter Island*, or *Vahou*, 20° E. of the Low Islands, in the direct route between them and Cape Horn, is only 20 miles in circumference, but is bold and rocky, strewed with lava, and contains numerous volcanic craters, which are now extinct. It formerly contained some traces of ancient civilization, in the shape of colossal statues, representing, though rudely, the upper parts of the human body; but these have now disappeared.

ANTARCTIC REGIONS.

DURING the sixteenth and seventeeth centuries, cosmographers entertained the opinion that there must be a continent towards the south pole, to counterbalance the mass of land which occupies so large a portion of the northern hemisphere; and, accordingly, in the maps of those centuries, this imaginary continent is represented under the name of *Terra-Australis-Incognita*. This notion continued to prevail till after the middle of the eighteenth century, when it was dispelled by the result of Cook's second voyage; that illustrious navigator having in the years 1772-3-4-5 traversed the Southern Ocean, in different directions, round the globe, without discovering any other land than the Island of Georgia and Sandwich land. In 1816, however, Captain William Smith discovered a group of lofty snow-capt islands, to which he gave the name of *New South Shetland*, to the S. E. of Cape Horn. A few years later, Captain Weddell discovered the *New Orkneys*, in the same quarter, and in 1823 penetrated to 74° 15′ S., the farthest point yet reached. *Trinity Land* was discovered by the Russian navigator, Bellinghausen; and in 1829, two small islands, named *Peter* and *Alexander*, between 69° and 70° S. lat., were also discovered by the Russians. In 1831, Captain Biscoe discovered *Enderby's Land*, under the Antarctic Circle, S. E. of the Cape of Good Hope; and in the following year, *Graham's Land*, *Biscoe Isles*, and *Adelaide Island*, in the same latitude, but lying due south of Cape Horn. In January 1839, a French expedition, under Captain D'Urville, discovered a tract of land, extending about 150 miles, between 66° and 67° S. lat., and 136° and 142° E. long., with a medium elevation of 1300 feet above the horizon. The snow and ice, which covered it, gave its surface almost a level appearance; but little else was observable than ravines, inlets, and projections, which presented not a single trace of vegetation. Captain D'Urville named his discovery *Terre Adelie* (Adelia's Land.) On the very same day, an American scientific expedition discovered land in 64° 50′ S. lat., and 154° 18′ E. long.; and one of the ships, the Vincennes, Captain Wilkes, ran down the coast, from 154° 18′ to 97° 45′ E. long., about 1700 miles, within a short distance of the land, being often so near as to get soundings with a few fathoms of line. In February 1839, Captain Balleny, of London, discovered the *Balleny Islands*, the central one of which lies in 66° 44′ S. lat., and 163° 11′ E. long. In 1840, an expedition was fitted out in Britain, under the command of Captain James Ross, R. N., for the purpose of making scientific, and particularly magnetic, observations in the Southern Ocean, and of ascertaining the position of the southern magnetic pole. Captain Ross first sailed to Hobart town, in Van Diemen's Land, and in November 1840, left that place for his first summer's research in the Antarctic regions. He first steered eastward to New Zealand, and leaving the Auckland Islands on the 12th of December, he proceeded to the southward, and entered the Antarctic circle on the 1st of January 1841, where his farther progress was stopped by the pack-edge of the ice. On 5th of January, he succeeded in entering the ice about 100 miles farther east, in lat. 66° 45′ S., and long. 174° 15′ E.; after penetrating a few miles, he was enabled to make his way to the southward with comparative ease and safety; and on the morning of the 9th, after sailing more than 200 miles through the pack, he gained a perfectly clear sea, and bore away south-west towards the magnetic pole. On the morning of the 11th, land was discovered in the distance, which, as it was approached, rose in lofty mountain peaks of from 2000 to 12,000 feet in height, completely covered with snow, with descending glaciers projecting many miles into the ocean, and presenting a perpendicular face of lofty cliffs. On the 12th Captain Ross landed on a small island, and took possession of the country in the name of Queen Victoria, whose name he has bestowed upon it. The island is composed wholly of igneous rocks, and is situate in 71° 56′ S. lat., and 171° 7′ E. long. Pursuing his course "along this magnificent land," on the 28th "a mountain, of 12,400 feet above the level of the sea, was seen emitting flame and smoke in splendid profusion. This magnificent volcano received the name of *Mount Erebus*, and is situate in 77° 32′ S. lat., and 167° 0′ E. long.; an extinct crater to the eastward, of somewhat less elevation, was called *Mount Terror*;" both after the ships which composed the expedition. The mainland preserved its southerly trending, and Captain Ross continued to follow it till his further progress in that direction was stopped by a lofty barrier of ice, extending E. S. E. Pursuing the examination of this barrier, he traced its continuity for 300 miles, and reached his highest latitude, 78° 4′ S.; but was prevented by the ice from reaching the magnetic pole, or finding shelter for his ships on any part of the coast, which he found at last to terminate abruptly in 70° 49′ S. lat., and 165 E. long.

Besides these new discoveries, there are within the limits of the Southern Ocean several islands, too far distant from any of the great continents to be considered as belonging to them, and therefore not yet noticed in this work. In 1772, two French Captains discovered a group of high and barren islands to the eastward of the Cape of Good Hope, which, from them, have been named *Marion and Crozet's Islands*; the two most westerly were afterwards named by Cook, who passed between them in December 1776, *Prince Edward's Islands*, in honour of the late Duke of Kent, father of her Majesty Queen Victoria. Farther east, between 48° and 50° S. lat., and 65° and 67° E. long., is *Kerguelen's Land*, or the *Island of Desolation*, discovered by Captain Kerguelen in 1772. It is about 100 miles in length, and about 60 in breadth; but, owing to the coldness and moisture of the climate, it is almost totally destitute of vegetation. It is indeed represented as one of the bleakest and most desolate spots on the globe; but fossil wood and coal have been recently discovered in it by Captain Ross, in the course of his scientific expedition to the South Magnetic Pole. It seems to be chiefly composed of trap and other igneous and volcanic rocks, which rise into hills from 500 to 2500 feet high. The coast is deeply indented with bays and inlets, and the whole surface is intersected by lakes and water-courses. North-east of Kerguelen's land are two small solitary islands, named *St Paul's* and *Amsterdam*, which were

discovered by the Dutch navigator Vlaming in 1696. Vlaming, it appears, applied the name of *Amsterdam* to the northern island, and *St. Paul's* to the southern; but the islands have been confounded by English navigators, and the names transposed, so that the southern island is generally called Amsterdam, and the northern, St. Paul's. But, be this as it may, the northern island is situate in 37° 52′ S. lat., and 77° 36′ E. long., and has an elevation of 2760 feet. It is 12 miles in circuit, and in fine weather may be seen from the anchorage of the southern island, a distance of 60 miles, on the same meridian. The latter, the original *St. Paul's*, is 9 miles in length by 5 in breadth, of volcanic formation, without a tree or shrub, and destitute of vegetation, except coarse grass, and a kind of rushes or reeds. It abounds with hot springs, the water of which is wholesome, though somewhat offensive to the smell and taste. It contains a magnificent oval-shaped basin, large enough to contain the whole British navy, which is evidently the crater of an extinct volcano, with deep water, and an entrance 25 yards wide.—(*Journal R. Geog. Soc.* IX. 517. *Staunton's Account of Macartney's Embassy*, I. 256.)

Sandwich Land, discovered by Cook in 1775, between 57° and 61° S. lat., and 27° and 30° W. long., has since been found to consist of a number of islands, which are constantly covered with snow. The *Isle of Georgia*, between 53° 57′ and 54° 57′ S. lat., and 38° 13′ and 35° 34′ W. long., about 31 leagues in length, by 10 in breadth, is also a bleak and barren region, traversed by very lofty mountains, constantly covered with snow; the heat of summer being sufficient only to melt the snow on the low ground of the N.E. side.

ADDITIONS AND CORRECTIONS.

Page 191.—From the result of the census taken 6th June 1841, it appears that the population of Great Britain and Ireland then amounted to about 27,000,000. The return for the three kingdoms, the Channel Islands, and the Isle of Man, is as follows:—

England and Wales,	15,901,931
Scotland,	2,624,595
Ireland,	8,306,362
Channel Islands and Man,	124,079
	26,956,066

Besides the army and navy, and merchant seamen afloat, and all persons travelling abroad, or not under a roof on the night of the 6th of June. Including these, the population may be taken at 27,500,000, which shows an increase of about 2,000,000 since 1831.

P. 241.—*Lancashire. Fleetwood-on-Wyre*, a newly established seaport town, near the mouth of the river Wyre, on the left bank, N.W. of Preston, with which it is connected by a railway. In June 1841, it contained 1509 inhabitants, on a spot which five years before was only a rabbit-warren.

P. 340.—In Table of Provinces, after Cordova, in Andalusia, insert:—
Jaen, 4,608.—266,000.—Jaen, Andujar, Linares, Alcala la Real, Baeza, Baylen, Ubeda.

P. 642.—*Euphrates.* Since this account was written, a secret expedition, consisting of two iron steam-boats, sent out by the East India Company, to ascertain the navigability of the river, has succeeded in ascending the course of the Euphrates, 1100 miles from its mouth. The only obstacle to the navigation consists in the remains of the water wheels used for irrigation. In the short space of 120 miles, nearly 200 were found, about one-third of which are still in operation. They consist of large walls built into the stream, for the purpose of diverting the current to the wheels, which lift up the water by means of clay vessels fixed on their circumference. These walls produce a current of six or seven knots, with a fall of two or three feet, so that this part of the river is difficult, and somewhat dangerous.

P. 663.—*Sinai and Horeb.* According to Dr. Robinson, in his "Biblical Researches in Palestine" recently published, it is Jebel Mousa that is supposed to be the Sinai of Moses; and it is the northern part of it, named Horeb by the Christians, and not the summit, which Dr. R. believes to be the place from which the law was delivered; there being in front of it a plain where the people might have stood, but which cannot be seen from the summit of the mountain. Jebel Katerin is situate to the south-west, and not to the east, of Jebel Mousa, which it overlooks; and the fortified convent of St. Catherine stands on the north-western flank of Jebel Mousa. Upon these points the descriptions of travellers are exceedingly discrepant, and void of precision; and it is from Dr. Robinson's map that we have learned exactly, for the first time, the relative situations of the mountains and convent.

P. 784.—*Ararat* is said to have broken out as a volcano in July 1840. This is a mistake. It was only shattered by an earthquake, which did immense damage to all the adjacent country.

* Burghs which have a Parliamentary Representation, but are not Royal Burghs.

INDEX OF PLACES.

☞ The letters B or G, C, I, L, M, R, at the end of names, signify *Bay* or *Gulf*, *Cape*, *Island*, *Lake*, *Mountain*, *River*. Names beginning with the prefix *New*, will be found under N; those with the prefix *Saint*, *San*, *St.*, under S; those with *Fort* or *Port*, under F or P. Spanish names beginning with X or J, may be looked for under either of these letters, the pronunciation of both being the same, and the use of them indifferent. Names beginning with C or K, if not found under the one of these letters, may be looked for under the other. Russian, Turkish, and other oriental names usually beginning with J, if not found under that letter, may be looked for under I or Y, the latter of which gives the correct pronunciation.
